Appendix B. Risk of Bias Assessment Tool

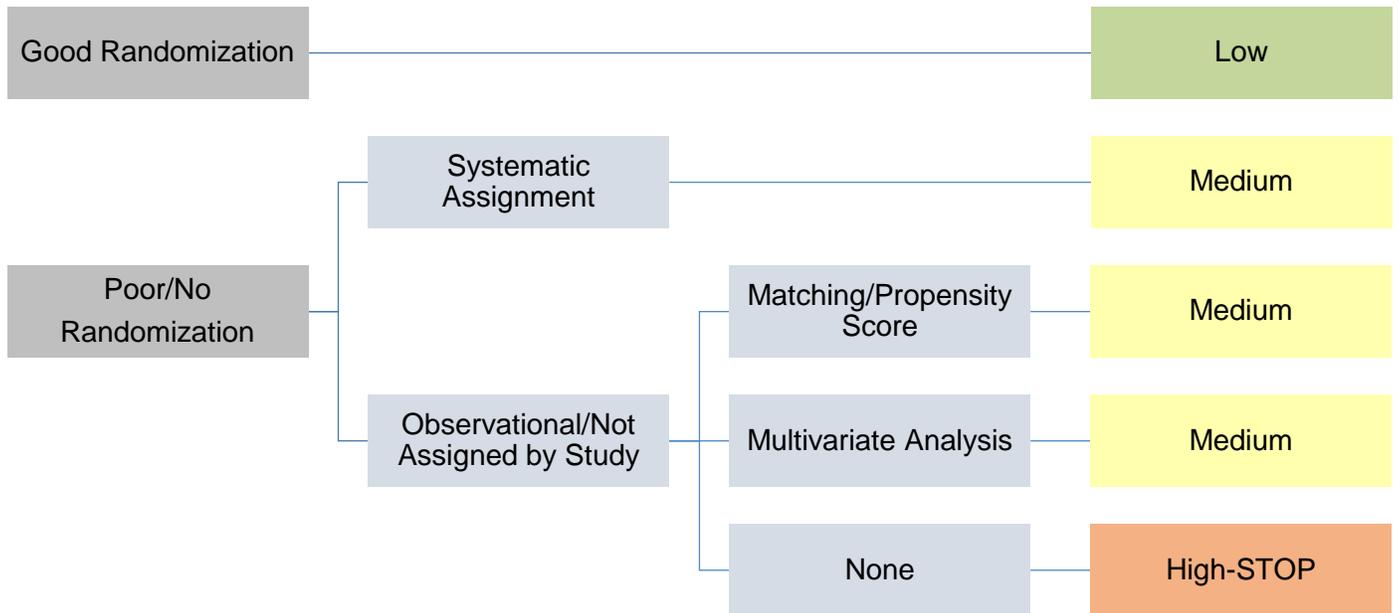

Review the methods of each trial and assess each risk of bias component as described in these instructions. You may need to have separate assessments for different outcomes (i.e. different measures; different time points may have different attrition rates). Remember, this tool is not an algorithm. Discretion must be applied.

1) Selection Bias

Systematic differences between baseline characteristics of the groups that arise from self-selection of treatments, physician-directed selection of treatments, or association of treatment assignments with demographic, clinical, or social characteristics.

- Did method of randomization create biased allocation to interventions (inadequate randomization)?
- “Good” Randomization: Random numbers table, computer random number generator
- “Poor” Randomization: Randomized based on week of the month of birthday
- No Randomization: Non-randomized clinical trial, observational study

Figure B1

2) Attrition

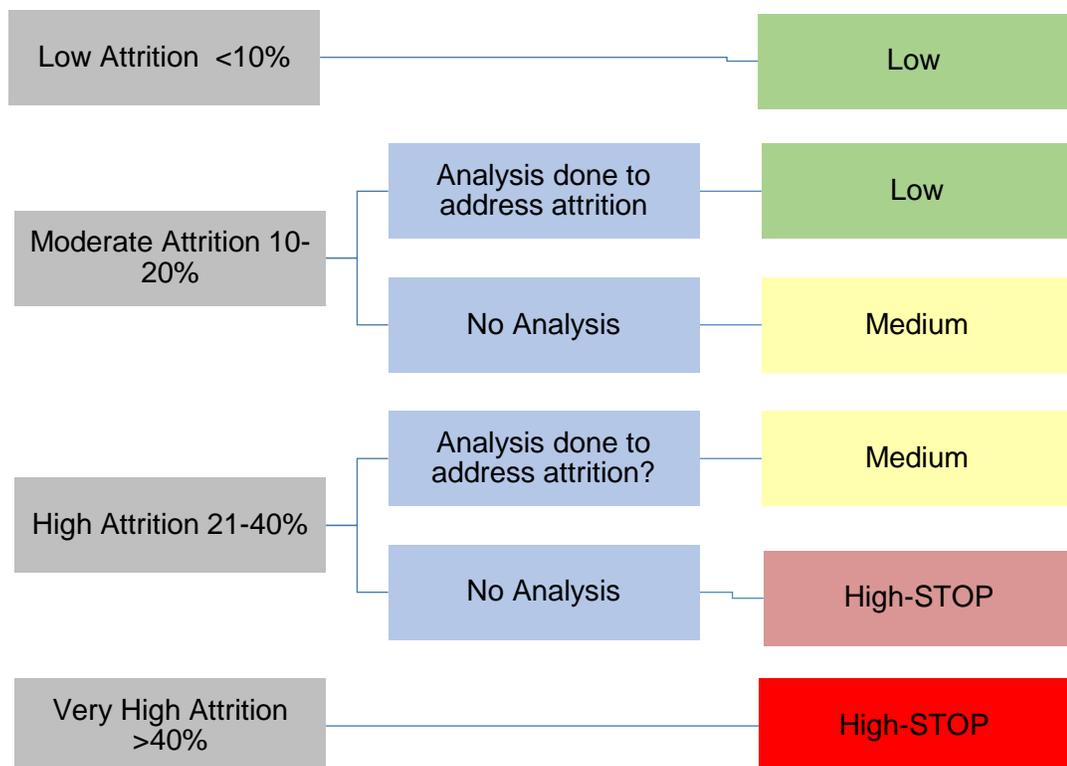

Systematic differences in the loss of participants from the study and how they were accounted for in the results (e.g., incomplete followup, differential attrition). Those who drop out of the study or who are lost to followup may be systematically different from those who remain in the study. Attrition bias can potentially change the collective (group) characteristics of the relevant groups and their observed outcomes in ways that affect study results by confounding and spurious associations.

- Reasons for incomplete/missing data adequately explained?
- Do the author's attempt to address attrition in the analysis?

Notes

- Report attrition rate in spreadsheet.
- If a study reports outcomes at multiple intervals (e.g., 6 months, 12 months, 18 months) assess attrition at each time-point and record separately.
- Analysis should be done with appropriate method (i.e., sensitivity analysis with various scenarios; last value forward would only be appropriate for interventions that are supposed to improve the outcomes (i.e., memory training that intends to improve memory)).

Figure B2

3) Selection and Attrition Bias Overall

Assess joint selection and attrition bias. If either selection or attrition bias is high, the risk of bias is HIGH.

Selection Bias	Low	Low	Medium	Low	Medium	Medium	High
Attrition Bias	Low	Medium	Low	High	Medium	High	X
Action	Assess other biases	Assess other biases	Assess other biases	STOP	Assess other biases	STOP	STOP

4) Other Biases

A. Detection Bias

Systematic differences in outcomes assessment among groups being compared, including systematic misclassification of the exposure or intervention, covariates, or outcomes because of variable definitions and timings, diagnostic thresholds, recall from memory, inadequate assessor blinding, and faulty measurement techniques. Erroneous statistical analysis might also affect the validity of effect estimates.

- Were the outcome assessors blinded to the intervention (“outcome assessor blinded”)?
- Was the timing of the outcome assessment similar in all groups (“comparable timing outcomes assessment”)?
- Was the scale used to measure outcomes validated, reliable?
- Were outcomes measured in clinically meaningful ways?

Domain	Options		Overall Rating
Outcome assessor blinded	Yes	No	All 4 Yes =Low 2 or 3 Yes = Medium 3+ No=High
Outcome assessor independent	Yes	No	
Comparable timing outcomes assessment	Yes	No	
Outcome assessment instrument/measurement quality	Yes (Adequate)	No (Inadequate)	

B. Performance Bias

Systematic differences in the care provided to participants and protocol deviation. Examples include contamination of the control group with the exposure or intervention, unbalanced provision of additional interventions or co-interventions, difference in co-interventions, and inadequate blinding of providers and participants.

Notes

- Intention-to-Treat (ITT): Includes every subject according to randomized treatment assignment. Ignores noncompliance, protocol deviations, withdrawal, and anything that happens after randomization.
- Concurrent Intervention: Study participants are receiving another intervention (i.e., treatment) that is not part of the intervention being tested. Example: Participants are randomized to a physical activity intervention (or no intervention), but are also dieting.

Domain	Options	Rating	Overall Rating
1a. RCTs-ITT	Yes	Low	<i>Low</i>
	No/Not reported	High	All Low=Low
1b. Obs-Adjustment for known confounders	Adequate	Low	1-Low, 2-Low, 3-N/A=Low
	Inadequate	High	<i>Medium</i> 1-Low, 2-Low, 3-High=Medium
2. Concurrent intervention	Yes-Adjusted	Medium	1-Low, 2-Medium, 3-Low=Medium
	Yes-Unadjusted	High	1-Low, 2-Medium, 3-N/A=Medium
	No	Low	1-Medium, 2-Medium, 3-N/A=Medium
	Unclear/Not Reported	NR	1-Medium, 2-High, 3-Low=Medium
3. Participant Blinding	Yes	Low	1-Medium, 2-Medium, 3-High=Medium
	No	Medium	<i>High</i>
	N/A	N/A	1-High + Anything Else=High 2+ High=High

C. Reporting Bias

Systematic differences between reported and unreported findings (e.g., differential reporting of outcomes or harms, incomplete reporting of study findings, potential for bias in reporting through source of funding).

- Was a select group of outcomes reported?

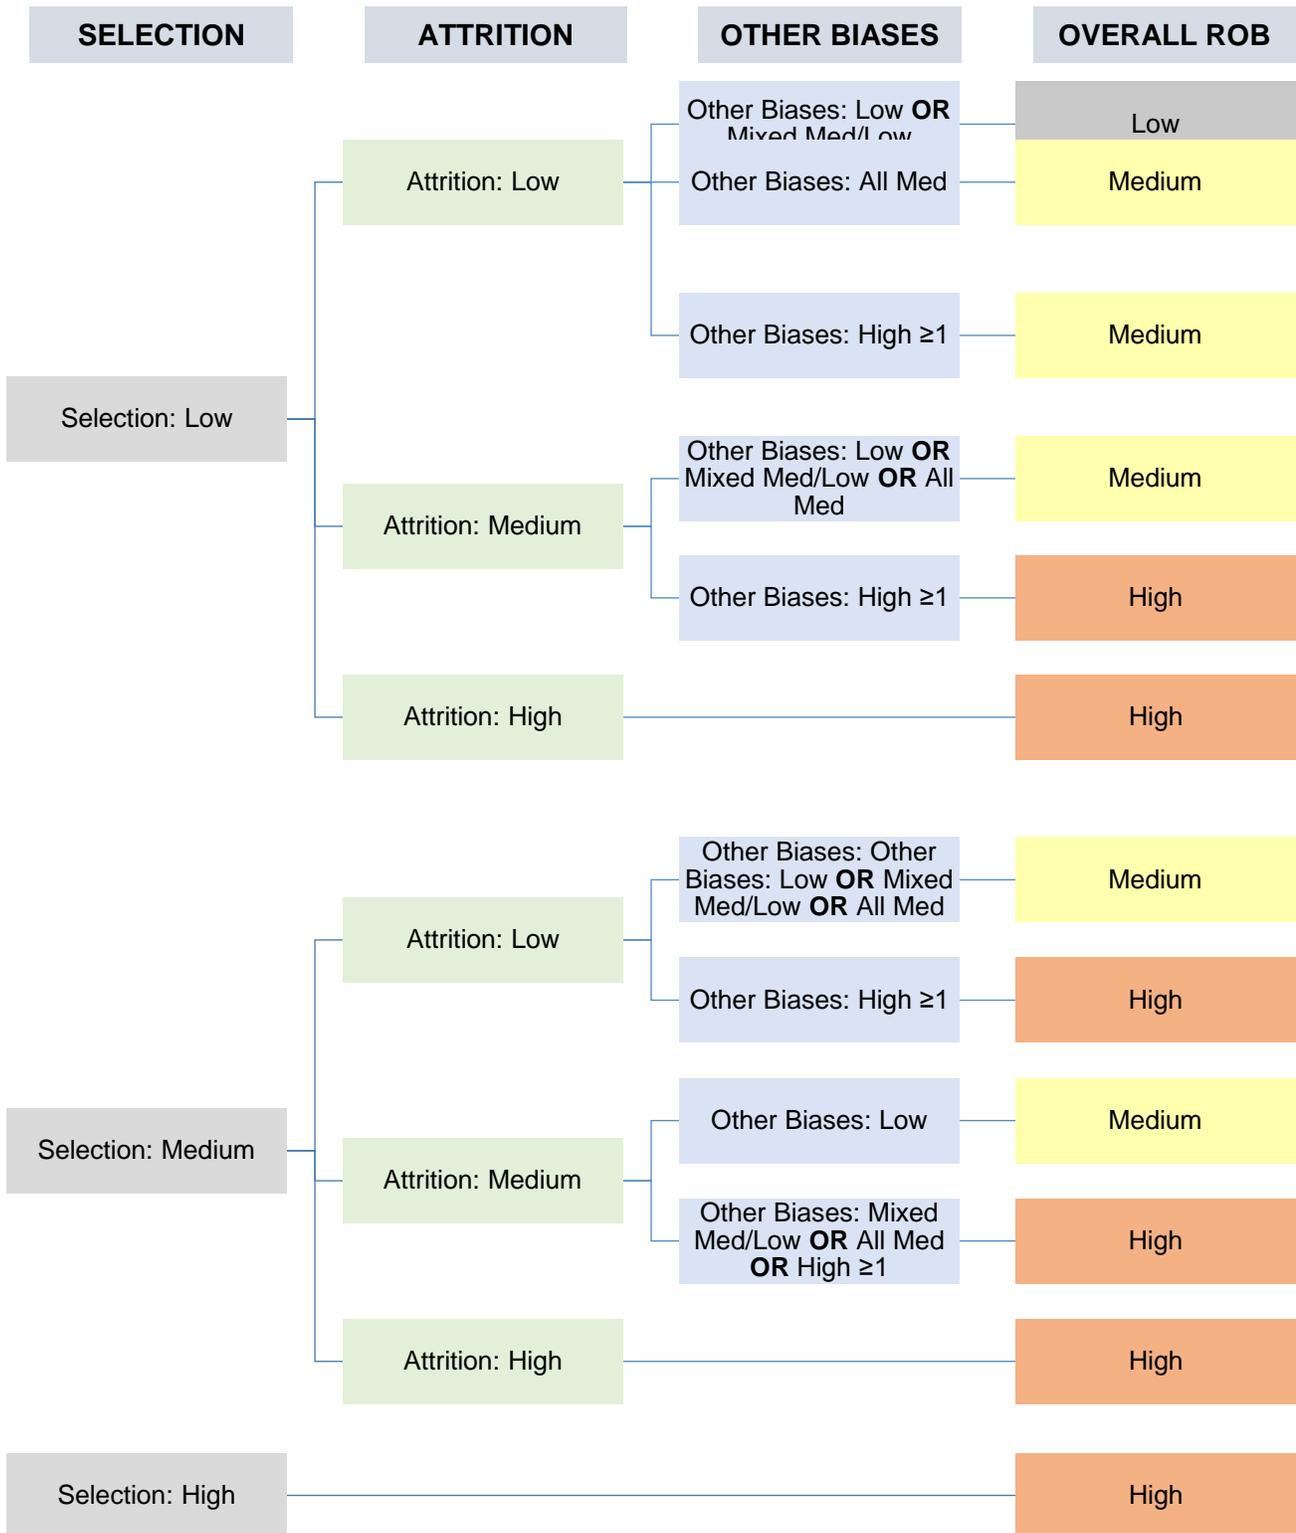

Notes

- Compare results to methods section and/ or protocol.
- Check if some results are reported in a different publication.

Domain	Options	Rating
All outcomes reported	Yes	Low
	No	Medium
	Not Reported	Medium

5) Overall Rob

Figure B3

Appendix C. Cognitive Performance Outcomes

Appendix Table C1. Cognitive outcomes categorization

Test Names	Common Abbreviations	Cognitive Outcome Categorization
Abstraction (Shibley Inst. of Living Scales subtest)		Executive/Attention/Processing Speed
AD Cooperative Studies AD Assessment Scale - Cognitive Subscale	ADAS-Cog, ADCS-Cog	Multidomain neuropsychological performance
AD Cooperative Studies ADL in MCI Scale	ADCS-MCI-ADL	Multidomain neuropsychological performance
AD Cooperative Studies Activities of Daily Living Scale	ADCS-ADL	Multidomain neuropsychological performance
Babcock Story Recall		Memory
Benton Visual Retention Test	BVRT	Memory
Blessed Dementia Rating Scale: Blessed Information Memory Concentration	BIMC	Brief cognitive test performance
Blessed Dementia Rating Scale: Blessed Rating Scale	BRS, DRS, BDS, Dementia score	Brief cognitive test performance
Block Design (WAIS subtest)	BD	Visuospatial
Boston Naming Test - multiple versions: 15, 30, 60-items	BNT	Language
Brief Visuospatial Memory Test	BVMT, BVMT-R	Memory
Brixton Spatial Anticipation Test	Brixton	Executive/Attention/Processing Speed
Buschke Selective Reminding Test	SRT	Memory
California Verbal Learning Test - multiple versions	CVLT, CVLT-II	Memory
Cancellation Tests (several versions: bell, star, letter, ...)		Visuospatial
Cambridge Neuropsychological Test Automated Battery (part of the CAMDEX)	CANTAB	Multidomain neuropsychological performance
CERAD word list / list learning subtest	CERAD	Memory
Clock Drawing Tests (many versions & featured in screening tools)	CDT, CLOX	Visuospatial
Cognitive Abilities Screening Instrument	CASI	Brief cognitive test performance
Consortium to Establish a Registry for Alzheimer's Disease (cognitive battery)	CERAD	Multidomain neuropsychological performance
Continuous Performance Test	CPT	Executive/Attention/Processing Speed

Corsi Block Tapping - forwards & backwards (similar to Spatial Span)		Executive/Attention/Processing Speed
Delis–Kaplan Executive Function System	D-KEFS	Executive/Attention/Processing Speed
Digit Span - forwards & backwards (WAIS/WMS subtest)	DS, DSp	Executive/Attention/Processing Speed
Digit Symbol Coding (WAIS subtest; inverse of Symbol Digit Modalities)	DSy	Executive/Attention/Processing Speed
East Boston Story or East Boston Memory Test	EBMT	Memory
Faces - parts I & II (WMS subtest)		Memory
Finger Tapping Test	FTT	Motor
Grip Strength / Hand Dynamometer		Motor
Grooved Pegboard		Motor
Hopkins Verbal Learning Test	HVLT, HVLT-R	Memory
Judgement of Line Orientation	JLO	Visuospatial
Letter Digit Substitution (Coding) Test	LDST	Executive/Attention/Processing Speed
Letter-Number Sequencing (most commonly a WAIS subtest)	LNS	Executive/Attention/Processing Speed
Letter Sets		Executive/Attention/Processing Speed
Logical Memory - parts I & II (WMS subtest)	LM, LMI, LMII	Memory
Matrix Reasoning (WAIS subtest)		Executive/Attention/Processing Speed
Mattis Dementia Rating Scale	MDRS, DRS	Multidomain neuropsychological performance
Maze Tracing (including Porteus Maze Test)		Executive/Attention/Processing Speed
Mini-Mental State Examination	MMSE	Brief cognitive test performance
Modified Mini-Mental State Examination	3MS, 3MSE	Brief cognitive test performance
Montreal Cognitive Assessment	MoCA	Brief cognitive test performance
N-Back		Executive/Attention/Processing Speed
National Adult Reading Test	NART	Language
Neurobehavioral Cognitive Status Examination (original Cognistat paper test)	NCSE	Multidomain neuropsychological performance
New York University Paragraph Recall		Memory
Number Series		Executive/Attention/Processing Speed
Picture Completion (many versions, most commonly a WAIS subtest)	PC	Executive/Attention/Processing Speed; Visuospatial
Purdue Pegboard	PPT, PPBT	Motor
Raven's Progressive Matrices (several versions)	RPM, RCPM	Executive/Attention/Processing Speed

including Colored & Advanced)		
Reaction Time Tests (many versions: simple, choice, auditory, visual...)	RT, SRT	Executive/Attention/Processing Speed
Repeatable Battery for the Assessment of Neuropsychological Status	RBANS	Multidomain neuropsychological performance
Rey Auditory Verbal Learning Test	RAVLT (may see AVLT or RVLTL)	Memory
Rey-Osterrieth Complex Figure Test	CFT, RCFT, Rey-O, Rey	Memory; Visuospatial
Rivermead Behavioral Memory Test - multiple versions	RBMT, RBMT-II, RBMT-3	Memory
Self-Ordered Pointing Task(Test)	SOPT	Executive/Attention/Processing Speed
Short Portable Mental Status Questionnaire	SPMSQ	Brief cognitive test performance
Short Test of Mental Status	STMS	Brief cognitive test performance
Syndrom Kurztest - SKT (German)	SKT	Executive/Attention/Processing Speed; Memory
Spatial Span - forwards & backwards (WMS subtest; similar to Corsi Block Tapping)		Executive/Attention/Processing Speed
Stroop - color, word, interference (there are many versions of the Stroop)		Executive/Attention/Processing Speed
Symbol Digit Modalities Test (inverse of Digit Symbol)	SDMT	Executive/Attention/Processing Speed
Taylor Complex Figure		Memory; Visuospatial
Telephone Interview for Cognitive Status	TICS	Brief cognitive test performance
Telephone Interview for Cognitive Status, modified	TICS-M, mTICS	Brief cognitive test performance
Token Test		Language
Trail Making Test - part A	TMT A	Executive/Attention/Processing Speed
Trail Making Test - part B (or B-A, B/A, etc.)	TMT B	Executive/Attention/Processing Speed
Verbal Fluency, Phonemic/Phonological or Letter	VF, PVF, FAS, CFL, COWAT, COWA	Executive/Attention/Processing Speed; Language
Verbal Fluency, Semantic or Category	VF, SVF, animals, names, fruits/vegetables	Language
Visual Reproduction (WMS subtest)	VR, VRI, VR II, Vis Rep	Memory
Useful Field of View	UFOV	Executive/Attention/Processing Speed
Walter Reed performance assessment battery		Multidomain neuropsychological performance
Wechsler Adult Intelligence Scale - multiple versions	WAIS, WAIS-R, WAIS-III, WAIS-IV	Multidomain neuropsychological performance
Wechsler Memory Scale - multiple versions	WMS, WMS-R, WMS-III,	Memory

	WMS-IV	
Wisconsin Card Sorting Test	WCST	Executive/Attention/Processing Speed

Appendix Table C2. Neuropsychological tests and reliable change indices

Cognitive Domain	Instrument	Measurement Properties	Reliable Change Indices
Global Cognitive Function	Alzheimer's Disease Assessment Scale-Cognitive subscale (ADAS-Cog)	Used to measure cognitive impairment in the assessment of Alzheimer's disease. Tests several cognitive domains, including memory, language, and praxis. Range: 0-70; higher scores indicate worse cognition ¹⁷	4 pts (6 months); considered to be clinically important, but not meaningful; no established RCI's ¹⁷
	Mini-Mental State Examination (MMSE)	11 items assessing cognitive function: orientation, registration, attention and calculation, recall, language (range 0-30) Range: 0-30; higher scores indicate better ¹⁸	2.73 pts (3 months) 3.60 pts (5 years) ¹⁹
	Modified Mini-Mental State Examination (3MS)	15 items: 11 from MMSE plus 4 additional items assessing long-term memory, abstract thinking, category fluency, delayed recall Range: 0-100; higher scores indicate better cognition ¹⁸	5 pts ²⁰ 7.41 pts (3 months) 9.82 pts (5 years) ¹⁹
	Telephone Interview for Cognitive Status (TICS)	11 items assessing word list memory, orientation, attention, repetition, conceptual knowledge, nonverbal praxis Range: 0-41; higher scores indicate better cognition ¹⁸	None identified
Executive, Attention, Processing Speed	Tower Test	Varying number of items assessing spatial planning, rule learning, inhibition of impulsive and perseverative responding, and the ability to establish and maintain instructional set. Subjects must construct towers using 5 circular pieces, placed onto one of 3 pegs. Towers constructed must be identical to a picture shown. Subjects are not allowed to place a larger piece on a smaller piece, and must move one piece at a time. Range: 0-30 ²¹	None identified
	Digit Span Forward*†	Varying number of items assessing attention efficiency and capacity: subjects asked to listen to a sequence of numbers read and then recite back in order (reported as either subscore or summary score with Digit Span Backward)	None identified; part of WAIS-III WMI and VIQ
	Digit Span Backward*†	Varying number of items assessing executive function and especially working memory: sequence of numbers read, participants asked to read sequence back in reverse order (reported as either subscore or summary score with Digit Span Forward)	None identified; part of WAIS-III WMI and VIQ

Cognitive Domain	Instrument	Measurement Properties	Reliable Change Indices
	Digit Symbol Substitution Test*	Varying number of items assessing psychomotor ability, sustained attention, processing speed and working memory: participants asked to use a key to substitute certain items within rows of numbers (Digit Symbol) or symbols (Symbol Digit Modalities) (score comprised of items completed within the specified time).	None identified; part of WAIS-III PSI and PIQ
	Stroop Interference Test	3 to 4 parts (depending on the version). Original version has 4 parts. Part 1: rows of written color names written in black ink, and the subject must say the written word. Part 2: the subject reads color names printed in colored ink, ignoring the printed color. Part 3: Subject names the colors of squares. Part 4: the subject uses the printed words from part 2, but must say the color of the ink each word is printed in instead of saying the word. Range: Time to completion and number of errors. Higher raw time and raw errors indicate worse cognition. ¹⁸	None identified
	Trail Making Test Part A (Trails A)	Assesses visual attention and processing speed: subject asked to draw lines connecting circled numbers in sequence (score comprised of both time to complete task and number of errors made; higher score indicates lower function, unless age-scaled score is presented) Range: Time, in seconds, required for completion; higher raw scores indicate worse cognition while higher scaled scores indicate better cognition. Additionally, if error rate is reported, then higher error rates indicate worse cognition. ¹⁸	Scores to calculate RCI: T2-T1 mean, SD: -0.96, 7.54 ²²
	Vigil/Continuous Performance Task (CPT)	Varying number of items assessing sustained and selective attention. Letters flash by one at a time on a computer screen. Subject must press the spacebar after they see an 'A' followed immediately by a 'K'. ¹⁸	None identified
	Wisconsin Card Sorting Test (WCST)	Cards are presented to the subject. Subject is told to match the cards, but not how to match; however, he or she is told whether a particular match is right or wrong. ¹⁸	None identified
Intelligence Quotient (Verbal Comprehension, Perceptual Reasoning, Working Memory, Processing Speed)	Wechsler Adult Intelligence Scale (WAIS)	Published battery of neuropsychological tests with varying numbers of core and optional subtests. WAIS-III assesses Verbal Comprehension (Similarities, Vocabulary, Information); Working Memory (Digit Span, Arithmetic, [Letter-Number Sequencing], [Comprehension]); Perceptual Organization (Picture Completion, Block Design, Matrix Reasoning); and Processing Speed (Digit Symbol, [Symbol Search], [Picture Arrangement], [Object Assembly]). [Bracketed] subtests are optional. ¹⁸	VIQ: 9 pts PIQ: 11 pts FSIQ: 9 pts VCI: 11 pts POI: 13 pts WMI: 1 2pts PSI: 14 pts (WAIS-III) ²³
Memory	Wechsler Memory Scale (WMS)	Published battery of neuropsychological tests with varying numbers of core and optional tests. WMS-III assesses auditory presentation (Logical Memory I and II, Verbal Paired Associates I and II, [Letter-Number Sequencing], [Information and Orientation], [Word Lists I and II], [Mental Control], [Digit Span]) and visual presentation (Faces I and II, Family Pictures I and II, [Spatial Span], [Visual Reproduction I and II]). ¹⁸	None identified

Cognitive Domain	Instrument	Measurement Properties	Reliable Change Indices
	Benton Visual Retention Test (BVRT)	<p>10 items (designs) assessing visual memory and perception: subjects are shown one design at a time and asked to draw it from memory (score based on either correctness of drawing or number of errors made; higher error scores indicate lower function)</p> <p>Range: 0-10; higher scores indicate better cognition¹⁸</p>	None identified
	Rey-Osterrich Complex Figure	<p>3 part test assessing visuospatial abilities, memory, attention, planning, and working memory (executive functions). Subject asked to reproduce a complicated line drawing 3 times: first by copying it while looking at the figure, second by reproducing it immediately afterwards from memory, and third by reproducing the figure again after a 20 to 30-minute delay¹⁸</p>	<p>Scores to calculate RCI: Copy T2-T1 mean, SD: - 0.03, 1.76 Immediate Recall T2-T1 mean, SD: 2.48, 4.51 Delayed Recall T2-T1 mean, SD: 2.30, 4.32²⁴</p>
	Buschke Selective Reminding Test	<p>12 items in one list assessing verbal recall and recognition, with a possible 12 trials. List is read aloud until subject recalls all 12 words three times in a row, or until items are read 12 total times (whichever occurs first). After a 20 to 30-minute delay, subjects are asked to recall the 12 words again. Then a recognition trial may be given, which consists of a longer list of words that is read one word at a time; subjects respond 'yes' or 'no' if the word was on the original list of 12.</p> <p>Range: 0-12 for each trial and the recognition score, with higher scores indicating better cognition. Also an intrusion score for the recognition portion, counting each incorrect 'yes' given; higher scores indicate worse cognition¹⁸</p>	None identified
	California Verbal Learning Test (CVLT)	<p>32 items in two lists (A & B) of 16 words assessing verbal recall and recognition: List A is presented five times for learning and List B is presented once as a distractor</p> <p>Range: Total Recall Score is 20-80; all other scores are z-scores -5 to +5; higher error and recency-recall index scores indicate worse cognition; all other higher scores indicate better cognition¹⁸</p>	None identified
	Rey Auditory Verbal Learning Test (RAVLT)	<p>30 items in two lists assessing verbal recall and recognition. First a list of 15 words is read aloud and subjects are asked to recall as many as possible (over 5 trials, with the list repeated each time). Then subjects are read a 15 word distractor list and asked to recall as many of the distractor words as possible (1 trial). Afterwards subjects are asked to recall as many of the original 15 words as possible (without being read the list). After a 20-minute delay period, subjects are asked to recall the original list of 15-words again (1 trial). Then a recognition trial may be given, which consists of a longer list of words that is read one word at a time; subjects respond 'yes' or 'no' if the word was on the original list of 15.</p> <p>Range: 0-15 for each trial (1-5, the distractor, delayed recall, and recognition) with higher scores indicating better cognition. Also an intrusion score for the recognition portion, counting each incorrect 'yes' given; higher scores indicate worse cognition.¹⁸</p>	<p>(decline; improvement) Trial 1:-2.77; 2.65 Trial 5: -3.51; 2.63 Sum 1-5: -11.64; 9.36 Interference: -3.03; 3.11 Trial 7: -4.73; 3.57 Delay: -4.96; 3.60 Recognition: -3.47; 3.69 (12 months)²⁵</p>

Cognitive Domain	Instrument	Measurement Properties	Reliable Change Indices
	Wechsler Adult Intelligence Scale (WAIS)	Published battery of neuropsychological tests with varying numbers of core and optional subtests. WAIS-III assesses Verbal Comprehension (Similarities, Vocabulary, Information); Working Memory (Digit Span, Arithmetic, [Letter-Number Sequencing], [Comprehension]); Perceptual Organization (Picture Completion, Block Design, Matrix Reasoning); and Processing Speed (Digit Symbol, [Symbol Search], [Picture Arrangement], [Object Assembly]). [Bracketed] subtests are optional. ¹⁸	VIQ: 9 pts PIQ: 11 pts FSIQ: 9 pts VCI: 11 pts POI: 13 pts WMI: 1 2pts PSI: 14 pts (WAIS-III) ²³
Language	Boston Naming Test (BNT)	60 items assessing word retrieval. Subjects are shown pictures and asked to name what they are pictures of, and receive semantic cues if needed Range: 0-60; higher scores indicate better cognition ¹⁸	4 pts (9-15 months); 6 pts (16-24 months)Sachs, 2012 #618}
	Verbal Fluency Test	Varying number of items assessing spontaneous verbal production: subjects asked to produce as many words beginning with a specific letter (phonemic/letter fluency) or as many words in a specific category such as "animals" (semantic/category fluency) as is possible in one minute Range (phonemic fluency): sum of all admissible words for the three letters; higher scores indicate better cognition Range (semantic fluency): sum of all admissible words for the semantic categories; higher scores indicate better cognition ¹⁸	(Decline; improvement) Letter 'S': -5.5; 9.8 Animals: -7.6; 10.5 (1 month) ²⁶

Appendix E. Prospective Cohort Studies

The Health and Medicine Division (HMD) committee of the National Academies of Sciences, Engineering, and Medicine (NASEM) provided a list of longitudinal studies that may provide evidence on interventions to prevent age-related cognitive decline, MCI, and clinical Alzheimer’s-type dementia. We used Google search engine to locate, where available, the longitudinal study’s website, and where not available, academic sites or curated databases that provided a description of the study. (Some longitudinal studies are hosted or conducted primarily in countries where English is not the first language; descriptions for those studies were drawn from the associated publications in the table.) Study descriptions were used to confirm the prospective cohort study design, usually interested in determining incidence or risk factors, and that treatment was not assigned.

For each study, we iteratively searched PubMed using the study name and a key word (such as “cognitive impairment” and “dementia”) derived from the search algorithms in Appendix A to identify related publications. These example articles were compared to the general search results to try to identify gaps in the literature. No gaps were found. Articles that were examples of the type of publication derived from the prospective cohort study but excluded from this review are provided in the table below. The studies were excluded because treatment was not assigned and appropriate techniques to address selection bias were not employed in order to provide information on causal relationships.

Next, for each study we again iteratively searched PubMed using the study name and key words that identify an analytic method that may be applied to a prospective cohort study to simulate an experimental design by “assigning” exposure to the intervention, for example, “instrumental variable” (IV) or “Mendelian randomization.” No publications were identified using this method.

As can be seen in the cohort study descriptions, many of these prospective cohort studies have been generating data for decades. The derivative publications can number in the hundreds, possibly greater than 1000 articles per cohort study. Given the potentially large number of publications, which, based on our searches, did not rise to inclusion criteria due to study design (treatment was not assigned or appropriate techniques to address selection bias were not employed in order to provide information on causal relationships), we did not provide full bibliographies for each cohort study.

Appendix Table E1. Prospective cohort studies searched for relevant literature

Committee-suggested Cohort Studies Country	Cohort Study Description	Example of excluded publication derived from cohort study
3C (Three Cities Study) France	The Three-City Study (3C Study) is a population-based longitudinal study aiming to examine the relation between vascular diseases and dementia in adults 65 years and older. http://www.three-city-study.com/the-three-city-study.php	Ancelin ML, et al. Baltimore Longitudinal Study of Aging (BLSA) US	The BLSA is a longitudinal study, with over 1300 participants currently and over 3100 since study inception. The aim of the study is to understand what is aging. Researchers measure physical and cognitive changes associated with aging in real time among a dedicated group of BLSA participants who come in for testing at regular intervals over the course of their lives. https://www.blsa.nih.gov/	Beydoun MA, et al. Statins and serum cholesterol's associations with incident dementia and mild cognitive impairment. Journal of epidemiology and community health. 2011;65(11):949-957. doi:10.1136/jech.2009.100826.
Cache County Study on Memory Health and Aging US	The study is designed to examine genetic and environmental factors associated with risk for Alzheimer's disease and other forms of dementia. Started in 1995, the study enrolled 5,092 permanent residents of the county (90%), including approximately 800 individuals aged 85 years and older. The CCMS is a longitudinal investigation of aging and Alzheimer's disease (AD) based in an exceptionally long-lived population residing in northern Utah. The elderly of Cache County have a longer life expectancy, higher educational attainment, and lower incidence of chronic disease (which can complicate the diagnosis of dementias) than other similar populations. http://www.usu.edu/epicenter/htm/studies/memorystudy	Peters M, et al. Cardiovascular Health Study	The Cardiovascular Health Study (CHS) is an NHLBI-funded observational study of risk factors for cardiovascular disease in adults 65 years or older. Starting in 1989,	Incidence of mild cognitive impairment in the Pittsburgh Cardiovascular Health Study–Cognition

Committee-suggested Cohort Studies Country	Cohort Study Description	Example of excluded publication derived from cohort study
(CHS) US	and continuing through 1999, participants underwent annual extensive clinical examinations. Measurements included traditional risk factors such as blood pressure and lipids as well as measures of subclinical disease, including echocardiography of the heart, carotid ultrasound, and cranial magnetic-resonance imaging (MRI). At six month intervals between clinic visits, and once clinic visits ended, participants were contacted by phone to ascertain hospitalizations and health status. The main outcomes are coronary heart disease (CHD), angina, heart failure (HF), stroke, transient ischemic attack (TIA), claudication, and mortality. Participants continue to be followed for these events. https://chs-nhlbi.org/	Study Oscar L. et. al. October 9, 2012, 79:15 1599-1606; published ahead of print September 26, 2012, doi:10.1212/WNL.0b013e31826e25f0: 1526-632X
Chicago Health and Aging Project (CHAP) US	CHAP is a longitudinal population study of common chronic health problems of older persons, especially of risk factors for incident Alzheimer's disease, in a biracial neighborhood of the south side of Chicago. http://www.alzrisk.org/cohort.aspx?cohortID=15&rfid=2	Morris MC, et al. Dietary intake of antioxidant nutrients and the risk of incident Alzheimer disease in a biracial community study. JAMA. 2002 Jun 26;287(24):3230-7.
Coronary Artery Risk Development in Young Adults Study (CARDIA) US	The Coronary Artery Risk Development in Young Adults (CARDIA) Study is a study examining the development and determinants of clinical and subclinical cardiovascular disease and their risk factors. It began in 1985-6 with a group of 5115 black and white men and women aged 18-30 years. The participants were selected so that there would be approximately the same number of people in subgroups of race, gender, education (high school or less and more than high school) and age (18-24 and 25-30) in each of 4 centers: Birmingham, AL; Chicago, IL; Minneapolis, MN; and Oakland, CA. http://www.cardia.dopm.uab.edu/	No relevant studies immediately found
Framingham Heart Study (note: Framingham cohorts include the Original, Offspring and Gen 3 cohorts) US	The objective of the Framingham Heart Study was to identify the common factors or characteristics that contribute to CVD by following its development over a long period of time in a large group of participants who had not yet developed overt symptoms of CVD or suffered a heart attack or stroke. The researchers recruited 5,209 men and women between the ages of 30 and 62 from the town of Framingham, Massachusetts. Since 1948, the subjects have continued to return to the study every two years for a detailed medical history, physical examination, and laboratory tests. In 1971, the Study enrolled a second generation - 5,124 of the original participants' adult children and their spouses - to participate in similar examinations. In 1994, the need to establish a new study reflecting a more diverse community of Framingham was recognized, and the first Omni cohort of the Framingham Heart Study was enrolled. In April 2002 the Study entered a new phase, the enrollment of a third generation of participants, the grandchildren of the Original Cohort. In 2003, a second group of Omni participants was enrolled. https://www.framinghamheartstudy.org/	Karakis I, et al. Association of Serum Vitamin D with the Risk of Incident Dementia and Subclinical Indices of Brain Aging: The Framingham Heart Study. J Alzheimers Dis. 2016. Epub 2016/02/19. doi: 10.3233/jad-150991. (PubMed ID Number: 26890771).
Health and Retirement Study (HRS)	The University of Michigan Health and Retirement Study (HRS) is a longitudinal panel study that surveys a representative sample of approximately 20,000 people in America over the age of 50 every two years. http://hrsonline.isr.umich.edu/	Saczynski JS, et al. Antidepressant Use and Cognitive Decline: The Health and Retirement Study. The American journal of medicine. 2015;128(7):739-746.

US		doi:10.1016/j.amjmed.2015.01.007.
Health, Aging and Body Composition Study (Health ABC) US	The HEALTH ABC Study will characterize the extent of change in body composition in older men and women, identify clinical conditions accelerating these changes, and examine the health impact of these changes on strength, endurance, disability, and weight-related diseases of old age. The study population consists of 3,075 persons age 70-79 at baseline with about equal numbers of men and women. Thirty-three percent of the men are African-Americans as are 46% of the women. All persons in the study were selected to be free of disability in activities of daily living and free of functional limitation (defined as any difficulty walking a quarter of a mile or any difficulty walking up 10 steps without resting) at baseline. https://www.nia.nih.gov/research/intramural-research-program/dynamics-health-aging-and-body-composition-health-abc	No relevant studies immediately found
Honolulu-Asia Aging Study (HAAS) US	The Honolulu-Asia Aging Study (HAAS) is a longitudinal epidemiologic investigation of rates, risk factors, and neuropathologic abnormalities associated with cognitive decline and dementia in aged Japanese-American men. http://www.alzrisk.org/cohort.aspx?cohortID=3&rfid=5	Taaffe, Dennis R., et al. "Physical activity, physical function, and incident dementia in elderly men: the Honolulu-Asia Aging Study." <i>The Journals of Gerontology Series A: Biological Sciences and Medical Sciences</i> 63.5 (2008): 529-535.
Kame Project (a cohort study of Japanese Americans in King County, Washington) US	A large population-based prospective study of Japanese Americans in King County, Washington, who were followed from 1992 to 2001, as part of the Ni-Hon-Sea Project, a cross-cultural study of prevalence and incidence rates of Alzheimer's disease and vascular dementia among Japanese populations living in Hiroshima, Japan; Oahu, Hawaii; and the metropolitan area of Seattle, Washington. http://www.alzrisk.org/cohort.aspx?cohortID=55&rfid=6	Dai Q, et al. Kungsholmen Project Sweden	The Kungsholmen Project is a longitudinal population-based study on ageing and dementia, carried out by the Stockholm Gerontology Research Center in collaboration with Aging Research Center (ARC), Karolinska Institutet. The project, which started in 1987, has gathered a 12-year long database and offers information on aging from a multidisciplinary perspective. http://www.kungsholmenproject.se/	Qiu C, et. al. Decline in blood pressure over time and risk of dementia: a longitudinal study from the Kungsholmen project. <i>Stroke</i> 2004;35:1810-5.
Leisure World Cohort Study (note: the Leisure World is now extended as the 90+ Study) US	The Leisure World Cohort Study was established to study the effect of modifiable lifestyle practices on longevity and successful aging when all residents of a California retirement community (Leisure World Laguna Hills) were mailed a postal health survey in 1981. New residents who moved into the community after this date were mailed the survey in 1982, 1983, and 1985. Of the 22,910 residents, 13,978 (61%) completed the questionnaire. The population and cohort are mostly Caucasian, well educated, upper-middle class, and elderly. https://www.mind.uci.edu/research/90plus-study/	Paganini-Hill, Annlia. "Hypertension and Dementia in the Elderly: The Leisure World Cohort Study." <i>International journal of hypertension</i> 2012 (2011).
Lothian Birth Cohorts	The Lothian Birth Cohorts of 1921 and 1936 are follow-up studies of the Scottish Mental Surveys of 1932 and 1947. The surveys had, respectively, tested the	No relevant studies immediately found

Committee-suggested Cohort Studies Country	Cohort Study Description	Example of excluded publication derived from cohort study
UK	intelligence of almost every child born in 1921 or 1936 and attending school in Scotland in the month of June in those years. Therefore, tracing, recruiting and re-testing people who had taken part in the Surveys offered a rare opportunity to examine the distribution and causes of cognitive ageing across most of the human life course. The studies described here were initially set up to study determinants of non-pathological cognitive ageing; i.e. the ageing of cognitive functions largely in the normal range, and not principally dementia or other pathological cognitive disorders http://www.lothianbirthcohort.ed.ac.uk/	
Mayo Clinic Study of Aging (MCSA) US	The MCSA is a population-based study that was designed to study incident mild cognitive impairment and dementia. The sampling frame included all persons aged 70–89 years who were residents of Olmsted County, Minnesota, as of October 1, 2004 (age- and sex-stratified random sample). The medical records of potential participants were formally reviewed prior to contact to exclude those with diagnoses of dementia, those in hospice care, or those considered to have conditions deemed imminently fatal. (Mayo Clinic does not appear to have a searchable site for this study.)	Vassilaki, Maria, et al. "Multimorbidity and risk of mild cognitive impairment." <i>Journal of the American Geriatrics Society</i> 63.9 (2015): 1783-1790.
MEMENTO France	This cohort aims at studying the evolution of a variety of potentially early signs (cognitive complaints, deficit in some domain of cognition, psycho-behavioural disturbances, changes in imaging or biological markers) of Alzheimer's disease and related dementia and to estimate the prognostic value of different markers (neuro-psychological, vascular, psychopathological, socio-educational, genetic, biological, neuro-imaging) on the progression to clinical dementia or severe cognitive deterioration stages, and then to death. http://www.memento-cohort.org/memento_web/Portals/0/Chercheurs/MEMENTO_Formulaire_AccesDonnees.pdf	No relevant studies immediately found
Minority Aging Research Study (MARS) US	The Minority Aging Research Study (MARS) began in 2004 and is a study of risk factors for cognitive decline in older Blacks. Participants are recruited from community-based organizations, churches, and senior-subsidized housing facilities; the catchment area is within that of MAP. Study participation requires agreeing to detailed annual clinical evaluations and cognitive testing. Between 2004 and 2007, >350 older persons enrolled in the study. https://www.rush.edu/services-treatments/alzheimers-disease-center/minority-aging-research-study	No relevant studies immediately found
Monongahela Valley Independent Elders Survey (MoVIES) US	The MoVIES project investigated various aspects of normal and abnormal aging. It also studied the incidence, risk factors, and outcome in late-life dementia, including Alzheimer's disease, in a prospective community-based epidemiologic study for 15 years. The study cohort was drawn from a rural, largely blue-collar community in the mid-Monongahela Valley of Southwestern Pennsylvania. The original cohort of 1681 individuals aged 65+ years was assembled between 1987 and 1989 and was followed until 2002 with multi-stage clinical "Waves" of cognitive and risk factor screening. Screening waves were interspersed with multi-stage clinical evaluations to detect the	No relevant studies immediately found

	presence of Alzheimer's and other dementias. http://www.wpic.pitt.edu/research/dementia_epidemiology/Movies/MoviesHomePage.htm	
Monongahela-Youghiogeny Healthy Aging Team (MYHAT) US	The MYHAT project seeks to describe the distribution of Cognitive Impairment, No Dementia (CIND) and Mild Cognitive Impairment (MCI) and related entities, their associated features, their outcomes over time, and the predictors of these outcomes. An age-stratified random community sample of approximately 2,100 was recruited and screened using cognitive, functional, and other health-related measures to identify the non-demented who are cognitively impaired. Among them, we identified subgroups meeting operational criteria for MCI of amnesic and other varieties. http://www.wpic.pitt.edu/research/dementia_epidemiology/MYHAT/MYHATHomePage.htm	Hughes TF, et al. Independent and combined effects of cognitive and physical activity on incident MCI. <i>Alzheimers and Dement</i> . 2015 Nov; 11(11): 1377-84. doi: 10.1016/j.jalz.2014.11.007. (PMC4536189) Ganguli M, et al. Rates and risk factors for progression to incident dementia vary by age in population cohort. <i>Neurology</i> , 84(1):72-80. (PMC4336092)
Multi-Ethnic Study of Atherosclerosis (MESA) US	The MESA study examines the characteristics of subclinical cardiovascular disease (disease detected non-invasively before it has produced clinical signs and symptoms) and the risk factors that predict progression to clinically overt cardiovascular disease or progression of the subclinical disease. From July 2000 to January 2012, MESA is a prospective population-based sample of 6,814 asymptomatic men and women aged 45-84. Approximately 38 percent of the recruited participants are white, 28 percent African-American, 22 percent Hispanic, and 12 percent Asian, predominantly of Chinese descent. https://www.mesa-nhlbi.org/	No relevant studies immediately found
Northern Manhattan Study (NOMAS) US	NOMAS) is a study of the population of Washington Heights in Northern Manhattan. The ongoing study, which began in 1990, is based in the Neurological Institute of Columbia Presbyterian Hospital, located in Washington Heights. NOMAS has enrolled over 4,400 people from the surrounding community. NOMAS is the first study of its kind to focus on stroke risk factors in whites, blacks, and Hispanics living in the same community. It is helping to fill gaps in our knowledge of stroke epidemiology in minority populations. http://columbianomas.org/	No relevant studies immediately found
Nurses' Health Study US	The Nurses' Health Studies are among the largest prospective investigations into the risk factors for major chronic diseases in women. Starting with the original Nurses' Health Study in 1976, the studies are now in their third generation with Nurses' Health Study 3 (which is still enrolling male and female nurses) and count more than 275,000 participants. http://www.nurseshealthstudy.org/	Devore, Elizabeth E., et al. Rochester Epidemiology Project (Olmsted County Study) US	The REP includes the medical records of all persons who have ever lived in Olmsted County, Minnesota between January 1, 1966 and the present, and who have given permission for their medical information to be used for research.[6] Those persons comprise more than 500,000 unique individuals and more than 6 million person years of follow-up through 2010. http://www.mayo.edu/research/centers-programs/rochester-epidemiology-project/overview	Savica, Rodolfo, et al. "Incidence of dementia with Lewy bodies and Parkinson disease dementia." <i>JAMA neurology</i> 70.11 (2013): 1396-1402.
Rotterdam Study Netherlands	The Rotterdam Elderly Study is a prospective cohort study in the Ommoord district in the city of Rotterdam, the Netherlands. Recruitment started in January 1990. The main objectives of the Rotterdam Study were to investigate the risk factors of cardiovascular, neurological, ophthalmological and endocrine diseases in the elderly. Up to 2008, approximately 15,000 subjects aged 45 years or over have been recruited. http://www.epib.nl/research/ergo.htm	Ruitenbergh A, et al. "Cerebral hypoperfusion and clinical onset of dementia: the Rotterdam Study." <i>Annals of neurology</i> 57.6 (2005): 789-794. Engelhart, Marianne J., et al. "Inflammatory proteins in plasma and the risk of dementia: the Rotterdam study." <i>Archives of neurology</i> 61.5 (2004): 668-672.
Rush Memory and Aging Project (MAP) US	The Rush MAP is a companion study that is more diverse in life experience make-up than ROS. Participants are older community-dwelling persons who are recruited and followed with nearly identical annual evaluations to ROS and all agree to donate brain, spinal cord, nerve and muscle to Rush investigator's at the time of death. More than 1,350 participants have enrolled and are seen annually and have had up to 13 clinical evaluations. https://www.rush.edu/services-treatments/alzheimers-disease-center/radc-research/memory-and-aging-project-rush	Buchman, A. S., et al. "Total daily physical activity and the risk of AD and cognitive decline in older adults." <i>Neurology</i> 78.17 (2012): 1323-1329.
The Sacramento Area Latino Study on Aging (SALSA) US	The Sacramento Area Latino Study on Aging (SALSA Study) project tracked the incidence of physical and cognitive impairment as well as dementia and cardiovascular diseases in elderly Latinos in the Sacramento, California, region. http://www.icpsr.umich.edu/icpsrweb/NACDA/studies/29323	Haan, Mary N., et al. "Homocysteine, B vitamins, and the incidence of dementia and cognitive impairment: results from the Sacramento Area Latino Study on Aging." <i>The American journal of clinical nutrition</i> 85.2 (2007): 511-517.
Singapore Longitudinal Ageing Study (SLAS)	Between September 2003 and December 2005, a whole population of older adults aged 55 years and above who were Singaporean residents in contiguous precincts in the South East region of Singapore were identified from a door-to-door census and invited to participate in the Singapore Longitudinal Ageing Study (SLAS). (No identifiable website)	Ng, Tze Pin, et al. "Metabolic Syndrome and the Risk of Mild Cognitive Impairment and Progression to Dementia: Follow-up of the Singapore Longitudinal Ageing Study Cohort." <i>JAMA neurology</i> 73.4 (2016): 456-463.

Committee-suggested Cohort Studies Country	Cohort Study Description	Example of excluded publication derived from cohort study
Singapore		
Study of Osteoporotic Fractures (SOF) US	The multi-center Study of Osteoporotic Fractures (SOF) has 20 years of prospective data about osteoporosis that has served as the basis for many findings about osteoporosis and aging in women \geq age 65. In addition to adjudication of fractures, SOF has tracked cases of incident breast cancer, and total and cause-specific mortality http://sof.ucsf.edu/interface/	Slinin, Yelena, et al. "Cystatin C and cognitive impairment 10 years later in older women." <i>The Journals of Gerontology Series A: Biological Sciences and Medical Sciences</i> 70.6 (2015): 771-778.
The Sydney Memory and Ageing Study (Sydney MAS) Australia	The Sydney Memory and Ageing Study (Sydney MAS) began in 2005 to examine the clinical characteristics and prevalence of mild cognitive impairment (MCI) and related syndromes, and to determine the rate of change in cognitive function over time. It is one of the largest longitudinal studies of this kind in Australia. At the baseline assessment from 2005 to 2007, 1037 non-demented individuals aged 70-90 were recruited from two areas of Sydney, following a random approach to 8914 individuals on the electoral roll. They underwent detailed neuropsychological and medical assessments and donated a blood sample for clinical chemistry, proteomics and genomics. https://cheba.unsw.edu.au/project/sydney-memory-and-ageing-study	Heffernan, Megan, et al. "Alcohol Consumption and Incident Dementia: Evidence from the Sydney Memory and Ageing Study." <i>Journal of Alzheimer's Disease Preprint</i> (2016): 1-10. Sachdev, Perminder S., et al. "Risk profiles for mild cognitive impairment vary by age and sex: the Sydney Memory and Ageing Study." <i>The American Journal of Geriatric Psychiatry</i> 20.10 (2012): 854-865.
UK Health and Lifestyle Study UK	The Health Survey for England (HSE) is an important annual survey looking at changes in the health and lifestyles of people all over the country. Around 8,000 adults and 2,000 children take part in the survey each year. Information is collected through an interview, and if participants agree, a visit from a specially trained nurse. The surveys, which have been carried out since 1991, provide regular information that cannot be obtained from other sources. https://www.ucl.ac.uk/hssrg/studies/hse	No relevant studies immediately found
Washington-Heights Inwood Columbia Aging Project (WHICAP) US	The Washington Heights-Hamilton Heights-Inwood Community Aging Project (WHICAP) is a community-based longitudinal study of aging and dementia among elderly, urban-dwelling residents. The project began enrolling patients in 1989 and has followed more than 5,900 residents over 65 years of age. The WHICAP study has enabled researchers to capture detailed information about the onset of dementia and how symptoms develop over time. http://www.alzrisk.org/cohort.aspx?cohortID=16&rfid=3	Helzner, Elizabeth P., et al. "Contribution of vascular risk factors to the progression in Alzheimer disease." <i>Archives of neurology</i> 66.3 (2009): 343-348.
Whitehall II Prospective Cohort Study UK	Whitehall II is a longitudinal, prospective cohort study of 10,308 women and men, all of whom were employed in the London offices of the British Civil Service at the time they were recruited to the study in 1985. The initial data collection included a clinical examination and self-report questionnaire. Research continues to explore the pathways and mechanisms through which social position influences health. The research group aims to build a causal model leading from social position through psychosocial and behavioural pathways to pathophysiological changes, sub-clinical markers of disease, functional change, and clinical disease. https://www.ucl.ac.uk/whitehallII	Singh-Manoux, Archana, et al. "Interleukin-6 and C-reactive protein as predictors of cognitive decline in late midlife." <i>Neurology</i> 83.6 (2014): 486-493. Akbaraly, Tasnime N., et al. "Metabolic Syndrome Over 10 Years and Cognitive Functioning in Late Midlife The Whitehall II study." <i>Diabetes care</i> 33.1 (2010): 84-89.

Appendix F. Cognitive Training Interventions

Appendix Table F2. Summary risk of bias assessments: ACTIVE trial

Study	Overall Risk of Bias Assessment	Rationale
Rebok 2014 ¹	High	Potential attrition bias with attrition rate of 57%.
Rebok 2013 ²	High	Potential attrition and reporting bias.
Jones 2013 ³	High	Attrition rate is greater than 21% with insufficient analysis to address potential for bias.
Sisco 2013 ⁴	High	Attrition rate is 33% with insufficient analysis to address potential for bias.
Valdes 2012 ⁵	High	Potential attrition and reporting bias.
Unverzagt 2012 ⁶	High	Attrition rate is 33% with insufficient analysis to address potential for bias.
Wolinsky 2010 ⁷	High	Potential attrition bias with attrition rate of 55%.
Wolinsky 2010b ⁸	High	Attrition rate is 36% with insufficient analysis to address potential for bias.
Unverzagt 2007 ⁹	High	Attrition rate is greater than 21% with insufficient analysis to address potential for bias.
Willis 2006 ¹⁰	High	Attrition rate is 33% with insufficient analysis to address potential for bias.
Ball 2002 ¹¹	Medium	Potential attrition and detection bias.

Appendix Table F3. Strength of evidence assessments: ACTIVE Trial

Outcome	# Trials (n)	Summary statistics [95% CI]	Study Limitations	Directness	Precision	Consistency	Reporting Bias	Optional Components	SOE
2-Year Outcomes									
Memory	1 (2,832)	Improvement with memory training intervention (ES=0.17). No significant differences with reasoning speed of processing training.	Medium	Indirect	Precise	Unknown	Undetected	NA	Moderate
Reasoning	1 (2,832)	Improvement with reasoning training (ES=0.257). No significant differences with memory or speed of processing training.	Medium	Indirect	Precise	Unknown	Undetected	NA	Moderate
Speed of Processing	1 (2,832)	Improvement with speed of processing training (ES=0.87). No significant differences with reasoning or memory training.	Medium	Indirect	Precise	Unknown	Undetected	NA	Moderate
5- and 10-Year Outcomes									
Diagnosis	1 (2,832)	No statistically significant differences between intervention arms (aggregate) and control (5-Years).	High	Direct	Precise	Unknown	Undetected	NA	Insufficient
Memory	1 (2,832)	<u>5-Years</u> Improvement with memory training (ES=0.23). No significant differences with reasoning speed of processing training. <u>10 Years</u> No statistically significant differences between intervention arms and control.	High	Indirect	Precise	Unknown	Undetected	NA	Low
Reasoning	1 (2,832)	Improvement with reasoning training (5-Years: ES=0.26; 10-Years: ES=0.23). No significant differences with memory or speed of processing training.	High	Indirect	Precise	Unknown	Undetected	NA	Low
Speed of Processing	1 (2,832)	<u>5-Years</u> Improvement with reasoning training (ES=0.15) and speed of processing training	High	Indirect	Precise	Unknown	Undetected	NA	Low

Outcome	# Trials (n)	Summary statistics [95% CI]	Study Limitations	Directness	Precision	Consistency	Reporting Bias	Optional Components	SOE
		(ES=0.076). No significant differences with memory training. <u>10 Years</u> Improvement with speed of processing training (ES=0.66). No significant differences with reasoning or memory training.							

ES=Effect Size

Appendix Table F4. Characteristics of eligible studies: other cognitive training trials in adults with normal cognition

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
Stine-Morrow 2014 ¹² RCT US Medium	461	Adults without dementia or neurological impairment Age, Mean (SD) 23 (7.6) 75% Female Race NR Education Level, Mean (SD) 15.4 (2.6) MoCA, Mean (SD) 26 (3)	Odyssey of the Mind engagement program –16 weekly meetings for 1.5 hours Home-based reasoning training -10 weekly lessons supplemented with 6 packs of crossword and Sudoku puzzles	Waitlist control	8 months	Visuospatial [Visuospatial Composite] Executive, Attention, Processing Speed [Processing Speed Composite] Memory [Episodic Memory Composite]
Carretti 2013 ¹³ RCT Italy Medium	40	Healthy older adults active in cultural and social activities in their neighborhood Age, Mean (SD) 70 (3.6) Sex NR Race NR Education, Mean (SD) 8.56 (4.3) Baseline Cognition NR	Six individual training sessions over 2 weeks (sessions 2-4 were training, sessions 1, 5, and 6 were for baseline, posttest, and 6 month follow-up, respectively)	Paper-and-pencil questionnaires	6 months	Memory [Categorization Working Memory Span Test (CWMS)] Memory [Working Memory Updating Word Span Test (Updating)]
Miller 2013 ¹⁴ RCT US Medium	84	Adults with no signs of dementia and a MMSE score of 24 or more Age, Mean (SD) 81.8 (6) 67% Female 96% White Years Education, Mean (SD) 16 (2.2) MMSE, Mean (SD)	Computer brain fitness program -5 days a week for 20-25 minutes/day for 8 weeks followed by 4 months of doing as many sessions as they preferred	Wait-list control -2 months wait period prior to access to intervention for 4 months	6 months	Memory [Delayed Memory Composite] Memory [Immediate Memory Composite] Language [Language Composite]

Appendix Table F5. Summary risk of bias assessments: other cognitive training trials in adults with normal cognition

Study	Overall Risk of Bias Assessment	Rationale
Stine-Morrow 2014 ¹²	Medium	Process for randomization is unclear with potential attrition bias.
Carretti 2013 ¹³	Medium	Process for randomization is unclear with potential performance bias.
Miller 2013 ¹⁴	Medium	Process for randomization is unclear with potential attrition bias.
Wolinsky 2013 ¹⁵	Low	No suspected biases
Cheng 2012 ¹⁶	High	Potential attrition bias with attrition rate of 40%.
Mortimer 2012 ¹⁷	High	Potential selection bias due to process for randomization
Szelag 2012 ¹⁸	High	Potential selection and attrition bias.
Evers 2011 ¹⁹	High	Potential selection, attrition, and performance bias.
Borella 2010 ²⁰	High	Process for randomization is unclear and potential detection bias.
Klusmann 2010 ²¹	Medium	Process for randomization is unclear with potential attrition bias.
McDougall 2010 ²²	High	Potential attrition and reporting bias.
Park 2009 ²³	High	Process for randomization is unclear with potential attrition and reporting bias.
Slegers 2009 ²⁴	High	Potential reporting bias and selection bias due to process for selecting participants.
Buiza 2008 ²⁵	High	Potential attrition, detection, and reporting bias.
Yesavage 2008 ²⁶	High	Potential attrition bias with attrition rate of 29%.

Appendix Table F6. Characteristics of eligible studies: other cognitive training trials in adults with MCI

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
Lam 2015 ²⁷ RCT China High	277	Chinese older adults with MCI (presence of subjective cognitive complaints, and objective impairments in cognitive function) Age, Mean (SD) 75.4 (6.5) 78.2% Female Race NR Education Level, Mean (SD) 3.9 (3.6) ADAS-cog, Mean (SD) 11.5 (3.3)	Cognitive and mind-body exercises -1 hour sessions 3 times/week	Cognitively demanding activities (e.g., reading and discussing news, board games) –At least 3 sessions/weeks	8 months 12 months	Diagnosis [CDR-SOB] Multidomain Neuropsychological Performance [ADAS-Cog (Chinese version)] Memory [Delayed recall] Brief Cognitive Test Performance [MMSE] Language [CVFT]
Vidovich 2015 ²⁸ RCT US Low (52 weeks) High (104 Weeks)	150	Adults age 65 years and older with MCI Age, Mean (SD) 75 (6) 54% Female 80% With High School Education Baseline Cognition NR	Cognitive activity training strategy program (attention, memory, and executive processes) -10, 90-minute sessions/week over 5 weeks; Booster telephone call at 6 months	Education about healthy aging -10, 90-minute sessions/week over 5 weeks; Booster telephone call at 6 months	52 weeks 104 weeks	Brief Cognitive Test Performance [CAMCOG-R score] Memory [CVLT-II Total Recall] Memory [CVLT-II Short Delay Free Recall] Memory [CVLT-II Long Delay Free Recall] Executive, Attention, Processing Speed [Digit Span Forward Span] Executive, Attention, Processing Speed [Digit Span Backward Span] Executive, Attention, Processing Speed [Digit Span Total Score] Executive, Attention, Processing Speed [TMT A time (sec)] Executive, Attention, Processing Speed [TMT B time (sec)] Executive, Attention, Processing Speed [Symbol Search (items completed)] Language, Executive, Attention, Processing Speed [COWAT Total Score]

Appendix Table F7. Summary risk of bias assessments: other cognitive training trials in adults with MCI

Study	Overall Risk of Bias Assessment	Rationale
Lam 2015 ²⁷	High	Potential selection bias with attrition greater than 21%
Vidovich 2015 ²⁸	Low (52 Weeks) High (104 weeks)	Attrition rate greater than 21% at 104 weeks with no analysis to address potential bias.
Fiatarone Singh 2014 ²⁹	High	Potential reporting bias.
Kwok 2013 ³⁰	Medium	Potential selection, attrition, and performance bias.
Rojas 2013 ³¹	High	Potential selection bias with an attrition rate of 35%.
Buschert 2012 ³² Forster 2011 ³³	Medium	Process for randomization is unclear.
Herrera 2012 ³⁴	Medium	Process for randomization is unclear with potential detection bias.
Moro 2012 ³⁵	High	Potential selection, detection, and performance bias.
Rapp 2002 ³⁶	Medium	Process for randomization unclear.

Appendix Table G3. Summary risk of bias assessments: physical activity interventions in adults with normal cognition

Study	Overall Risk of Bias Assessment	Rationale
Antunes 2015 ¹¹	Medium	Process for randomization is unclear/poorly described.
Bun 2015 ¹	High	No randomization (participants self-selected into study arms) and attrition greater than 21%.
Eggenberger 2015 ¹⁵	Medium	Attrition rate is 20% with potential performance bias.
Ferreira 2015 ¹⁶	High	High attrition rate with suspected reporting bias.
Sink 2015 ⁴	Medium	Attrition 10%; potential differences in timing of certain outcomes measurements.
Napoli 2014 ³	Medium	Process for randomization is unclear and 13% attrition rate.
Satoh 2014 ¹²	High	Semi-randomly assigned groups and 33% attrition rate.
van de Rest 2014 ^{20, 21}	Medium	Attrition is 15% with potential reporting bias.
Mortimer 2012 ¹³	High	Suspected selection bias due to modifications post-randomization.
Nguyen 2012 ¹⁴	High	Randomization not well described with 24% attrition rate.
Hotting, 2011 ¹⁷	High	Suspected selection bias due to selection procedure for control group.
Baker 2010 ^{18, 19}	Medium	Attrition is 18% with potential reporting bias
Klusmann 2010 ⁴ Evers 2011 ⁵	High	Attrition is over 25% with no analysis to address potential bias.
Muscari 2010 ²²	Medium	Randomization not well described with 11% attrition rate.
Rosano 2010 ⁶	High	Participants self-selected for inclusion for additional follow-up based on willingness to participate. High attrition rate from original study population.
Taylor-Pillae 2010 ⁷	High-12 mo outcomes Medium-6 mo outcomes	Randomization not well described with 21% attrition at 12 months.
Williamson 2009 ⁸	Medium	Potential performance and reporting bias.
Lautenschlager 2008 ²³	Low	No suspected biases.
Cassilhas 2007 ¹⁰	Medium	Randomization not well described with potential reporting bias.

Appendix Table G4. Strength of evidence assessments: physical activity interventions versus inactive control in adults with normal cognition

Outcome	# Trials (n)	Summary statistics [95% CI]	Study Limitations	Directness	Precision	Consistency	Reporting Bias	Optional Components	SOE
Multicomponent Physical Activity									
Dementia	1 (1635)	OR: 0.96 [0.57 to 1.63]	Medium	Direct	Imprecise	Unknown	Undetected	NA	Insufficient

Appendix Table G8. Summary risk of bias assessments: physical activity interventions in adults with MCI

Study	Overall Risk of Bias Assessment	Rationale
Hildreth 2015 ²⁷	Medium	Attrition rate is 15% with differential attrition rates in study arms. No analysis to address potential attrition bias.
Fiatarone Singh 2014 ²⁶	High	Suspected reporting bias. Results for intervention arms are combined in the analysis,
ten Brinke 2015 ³⁰	High	Attrition rates is over 21% with no analysis to address potential attrition bias.
Law 2014 ²⁹	Medium	Randomization not fully described and potential detection bias.
Nagamatsu 2013 ³¹	Medium Spatial Memory: High	Unaccounted differences in sample size for outcome measures. Spatial memory outcome is rated high due to high rate of attrition for outcome measure.
Suzuki 2013 ²⁴	Medium	Attrition and suspected performance bias.
Lam 2012 ³²	High	Attrition rate is over 30% with no analysis to address potential attrition bias.
Suzuki 2012 ²⁵	Medium	Randomization not adequately described.
Baker 2010 ¹⁹	High	Suspected reporting bias based on reporting of study results.
Lautenschlager 2008 ²³	Low	No suspected biases.

Appendix H. Nutraceutical Interventions

Appendix Table H1. Characteristics of eligible studies: nutraceutical interventions in adults with normal cognition

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
Omega 3 fatty acids efficacy						
Cukierman-Yaffe, 2014 ¹ (Substudy of ORIGIN trial) RCT Multinational Medium (High for outcomes at t5 for MMSE and t6 for DSS)	15077	Adults older than 50 with dysglycaemia, with additional risk factors for cardiovascular events, not taking insulin, and taking no more than 1 oral glucose drug. Mean age (SD): 63 (7.75) 35% female 59% white Education: 35% <8 years 27% 9-12 years 38% >12 years Mean MMSE (SD): 28 (2.75)	Omega 3 (EPA 465 mg+ DHA 375 mg) daily for 6 years	Placebo daily for 6 years	Median 6.2 years	Diagnosis [incident probable cognitive impairment = reported dementia or an MMSE score of <24] Screening [MMSE] Executive/attention/processing speed [DSS - WAIS]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
Witte, 2014 ² RCT Germany Medium	80	Healthy adults aged 50-75 years Mean age (SD): 64 (± 6.5) years 46 % female Race not reported Mean education (SD) (range 0=no educ - 5=college): 4.2 (1.2) Mean MMSE (SD): 29.3 (1)	Omega 3 (fish oil, 2.2 g) daily for 6 months	Placebo capsules (sunflower oil) daily for 6 months (26 weeks)	6 months	Biomarkers [MRI: gray matter changes and white matter integrity] Executive/attention/processing speed [executive function composite = phonemic fluency, semantic fluency, TMT A, TMT B, Stroop parts 1 & 2] [attention composite = z digit span forward] [sensorimotor speed composite = TMT A, Stroop parts A & B, Digit Span Forward] Memory [memory composite = AVLT learning, AVLT delayed recall, AVLT recognition, digit span backward]
Stonehouse, 2013 ³ RCT New Zealand High	176	Healthy adults with normal cognition aged 18-45 years & low DHA intake Mean age (SD): 33.3 (7.8) years 64% female 80% European 28% secondary education 72% tertiary education Baseline global cog not reported	Omega 3 (DHA 1.16 g) daily for 6 months	Placebo daily for 6 months	6 months	Executive/attention/processing speed [composite attention = Stroop test, choice reaction time, and digit vigilance] [reaction time attention] [processing speed = finding As task] [reaction time episodic memory] [reaction time working memory] Memory [composite episodic memory = immediate and delayed word recall, delayed word recognition, and delayed picture recognition] [composite working memory = n-back, Corsi blocks, and a letter-number sequencing task]
Geleijnse, 2012 ⁴ RCT subset Netherlands Medium	2911	Coronary patients aged 60-80 years Mean age (SD): 69 (5.5) years 22% female Race not reported 22% elementary ed 50% secondary	Omega 3 (EPA-DHA 400 mg or ALA 200 mg) daily for 40 months (There is also an EPA-DHA + ALA arm; however, 2X2 factorial design was collapsed	Placebo daily for 40 months	40 months	Screening [MMSE] [risk of cognitive decline based on MMSE score]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
		educ 16% higher vocational educ 12% college Mean MMSE (SD): 28.3 (1.6)	into combined group analysis of all EPA-DHA vs placebo and all ALA versus placebo)			
Andreeva, 2011 ⁵ RCT followup France Medium	1748	Adults with normal cognition aged 45-80 with a history of ischemic heart disease Mean age (SD): 61 (8.8) years 20% female Race not reported 10% foreign-born 58% < high school Mean Isaacs Set Test (SD): 35.8 (7.5)	Omega 3 (EPA + DHA 600 mg in a 2:1 ratio) daily for 4 years or Omega 3 + Vitamin B for 4 years	Placebo for 4 years	4 years	Screening [F-TICS-m total score] Memory [F-TICS-m memory subscore] [F-TICS-m recall subscore]
Dangour, 2010 ⁶ RCT UK Medium	867	Cognitively healthy adults aged 70-79 years, MMSE \geq 24 Mean age (SD): 75 (2.6) years 58% aged 70-74 42% aged 75-79 45% female Race not reported Education: 33% no qualifications 26% O level, clerical	Omega 3 (EPA 200 mg + DHA 500 mg) daily for 2 years	Olive oil capsules for 2 years	2 years	Multidomain composite [composite: CVLT sum of words, CVLT delayed recall, prospective memory tests 1, 2, 3, story recall-delayed, verbal fluency, letter cancellation, location memory, location memory-delayed, symbol-letter substitution, digit span forward & backward, simple reaction time, choice reaction time] Executive/attention/processing speed [executive composite: digit span backward, verbal fluency] [processing composite: letter cancellation, simple reaction time, choice reaction time, symbol-letter substitution] [letter search/cancellation - # correct, % of

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
		18% A level, college 23% other Median MMSE (IQR): 29 (28, 30)				total attempts] [symbol letter modality - # correct] [reaction time - simple] [reaction time - choice] [digit span forward] [digit span backward] Memory [memory composite: sum of words recalled, CVLT delayed recall, location memory, location memory-delayed, story recall, story recall-delayed] [global delay composite: CVLT delayed recall, location memory delayed recall, story recall delayed] [CVLT - words correct in 1st 3 trials] [CVLT - words recalled at delayed recall] [story recall - immediate] [story recall - delayed] [spatial memory - # of correct images - immediate] [spatial memory - # correct images - delayed] Language [verbal fluency - # animals named]
Yurko-Mauro, 2010 ⁷ RCT US Low/Medium	485	Healthy adults aged 55+ with MMSE scores >26 and a Logical Memory (WMS III) baseline score of at least 1 SD below younger adults Mean age (SD): 70 (9) years 58% female 84% white Logical memory – immediate recall (SD): 25 (6.8) Logical memory – delayed recall (SD): 11.3 (4.1)	Omega 3 (DHA 900 mg) daily for 6 months	Placebo daily for 6 months	6 months	Screening [MMSE] Executive/attention/processing speed [CANTAB Stockings of Cambridge] Memory [CANTAB PAL] [CANTAB VRM – free recall] [CANTAB VRM - immediate recall] [CANTAB VRM - delayed recall] [CANTAB SWM] [CANTAB PRM - delayed]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
Van de Rest, 2008 ⁸ RCT Netherlands Low	302	Cognitively healthy (MMSE ≥21) adults aged 65+ Mean age (SD): 70 (3.5) years 45% female Race not reported Education: 9% low 54% medium 37% high Median MMSE (IQR): 28 (27-29)	Omega 3 (EPA-DHA 400 mg or 1800 mg) daily for 6 months	Placebo capsules for 6 months	6 months	Executive/attention/processing speed [executive function composite: TMT A, TMT B, word fluency-animals, word fluency-letters] [attention: digit span forward] [sensorimotor speed: TMT A, Stroop part 1, Stroop part 2] [TMT A] [TMT B] [Stroop part 1] [Stroop part 2] [Stroop part 3 – (part 1 + part 2/2)] Memory [memory composite: 15 word learning-immediate, word learning-delayed, word learning recognition, digit span backward] Language [word fluency-animals] [word fluency-letter]
Ginkgo biloba efficacy						
Lewis, 2014 ⁹ RCT USA High	97	English-speaking, nonsmoking, healthy older adults aged 60+ with an MMSE score ≥ 23 Mean age (SD): 69 (7) years 72% female 83% white Education: 12% ≤ high school 35% some post-high school training 25% college grad 28% ≥ master's degree No baseline cognition reported other than inclusion	Ginkgo Synergy for 6 months (2 capsules/day providing 120 mg/d Ginkgo biloba leaf, 80 mg/d Ginkgo biloba whole extract, plus various other extracts)	Placebo (cellulose, lactose, and beet powder) for 6 months	6 months	Screening [MMSE] Executive/attention/processing speed [Stroop color and word test] [TMT A] [TMT B] [digit symbol subtest, WAIS-III] Memory [HVLt-R] Language [COWA]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
		criteria				
Vellas, 2012 ¹⁰ France RCT Medium	2854	Adults aged 70+ who spontaneously reported memory complaints to their primary care physician; screened and excluded diagnosed dementia, major memory impairment Mean age (SD): 76 (4.4) years 67% female Race not reported Education: 14% no formal educ 37% primary school 24% some secondary educ 24% high school diploma Mean MMSE (SD): 27.6 (1.9)	Ginkgo biloba extract (EGb761) 120 mg twice daily for at least 4 years	Matched placebo for at least 4 years	5 years	Diagnosis [incidence of probable AD according to DSM-IV and NINCDS-ADRDA criteria at 5 years]
Snitz, 2009 ¹¹ DeKosky, 2008 ¹² RCT USA Low	3069 (normal cog & MCI) 2587 normal cog	Community-dwelling participants aged 72 to 96 years; 15% baseline MCI Mean age (SD):	Ginkgo biloba extract 120 mg twice daily for a median of 6.1 years	Identical appearing placebo for a median of 6.1 years	Global cognition: average annual change reported	Diagnosis: incident dementia & AD (5 categories) [All dementia] [AD without vascular dementia] [AD with vascular dementia] [total AD [vascular dementia without AD] Multidomain composite [global composite:

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
		79.1 (3.3) years 46% female 95% white Education mean (SD): 14.4 (3) years Mean 3MSE (SD): 93.4 (4.7)			Other cognitive outcomes at year 4	3MSE and ADAS-Cog (using TICS when 3MSE not possible) Executive/attention/processing speed [executive composite: TMT B & Stroop color word test] [attention and psychomotor speed composite: WAIS-R digit span and TMT A] [TMT B] [Stroop color/word Test] [TMT A] [WAIS-R digit span] Memory [memory composite: CVLT & recall conditions - Modified Rey Osterrieth figure test] [CVLT] [recall conditions - Modified Rey Osterrieth figure test] Visuospatial [visuospatial composite: copy condition of the Rey Osterrieth figure test & M-WAIS-R Block Design] [copy condition of the Rey Osterrieth figure test] [modified WAIS-R block design] Language [language composite: 30-item Boston Naming Test & semantic verbal fluency] [30-item Boston Naming Test] [semantic verbal fluency]
Dodge, 2008 ¹³ RCT USA Medium	118	Cognitively intact subjects aged 85+ Mean age (SD): 87.5 (2) years 60% female Race not reported Mean education (SD): 14 (2.5) years Mean MMSE (SD): 28.25 (1.4)	Ginkgo biloba extract 80 mg three times daily (240 mg/d) for 3 years 6 months	Placebo	3 years 6 months	Diagnosis (estimate): [mild cognitive decline defined as progress from CDR = 0 to CDR = 0.5] Memory [CERAD word list delayed recall]
Multi-nutraceutical						

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
supplement efficacy						
Lewis, 2014 ⁹ RCT USA High	97	Healthy older adults aged 60+ with an MMSE score ≥ 23 Mean age (SD): 69 (7) years 72% female 83% white Education: 12% \leq high school 35% some post-high school training 25% college grad 28% \geq master's No baseline cognition reported other than inclusion criteria	OPC Synergy for 6 months (2 capsules/d providing 100 mg/d grape seed extract, 50 mg/d green tea extract, 50 mg/d bilberry fruit, dried buckwheat leaf and juice, green tea leaf powder, and dried carrot root plus Catalyn (4 tablets/d providing 312 IU/d vitamin D, 1600 IU/d vitamin A, 5.3 mg/d vitamin C, 0.3 mg/d thiamine, 0.3 mg/d riboflavin, 1.3 mg/d vitamin B6, defatted wheat germ, carrot (root), and various other ingredients.	Placebo (cellulose, lactose, and beet powder) for 6 months	6 months	Screening [MMSE] Executive/attention/processing speed [Stroop color and word test] [TMT A] [TMT B] [DSS, WAIS-III] Memory [HVLt-R] Language [COWA]
Resveratrol efficacy						
Witte, 2014 ¹⁴ RCT Germany Medium	46	Healthy overweight older adults aged 50-80 years Mean age (SD): 64 (6) years 64% female Race not reported Mean education (SD): 17 (3) years	Resveratrol (200 mg/d) for 6 months	Placebo for 6 months	6 months	Biomarkers [MRI: volume, microstructure, and functional connectivity of the hippocampus] Memory [AVLT retention] [AVLT delayed recall] [AVLT recognition] [AVLT learning ability] [AVLT 5th learning trial]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
		Mean MMSE (SD): 29 (1)				
Red clover & black cohosh efficacy						
Maki, 2009 ¹⁵ RCT USA High	66 (originally randomized 89)	Midlife women with ≥35 hot flashes weekly Mean age (SD): 53 (4.25) years 100% female 44% white 53% African Amer Education not reported Baseline cognition not reported	Red clover (120 mg) or black cohosh (128 mg) daily for 1 year	Matching placebo daily for 1 year	1 year	Memory [CVLT] [logical memory subtest of WMS-R] [Benton Visual Retention Test] Executive/attention/processing speed [digit span forward] [digit span backward] [brief test of attention - modified] [finding As test] Language [letter fluency] Visuospatial [modified card rotations test]
Plant sterols/ plant stanols efficacy						
Schiepers, 2009 ¹⁶ RCT Netherlands Medium	57	People aged 43-69 years taking statins Mean age (SD): 60 (7) years 42% female Race not reported 39% low education Baseline cognition not reported	Margarines enriched with plant sterol esters (2.5 g/d) or plant stanol esters (2.5 g/d) for 7 years (85 weeks)	Control margarine for 7 years (85 weeks)	7 years (85 weeks)	Executive/attention/processing speed [simple information processing speed composite: Stroop 1, Stroop 2, concept shifting test A, concept shifting test B] [complex speed composite: Stroop 3, complex shifting test] [letter digit substitution] Memory [composite: Visual Verbal Word Learning Task total free recall, delayed recall, recognition]
Omega 3 comparative effectiveness						

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
Andreeva, 2011 ⁵ RCT France Medium	1748	People with normal cognition aged 45-80 with a history of ischemic heart disease Mean age (SD): 61 (8.8) years 20% female 10% foreign-born 58% < high school diploma Mean F-TICS-m (SD): 28.5 (4.8)	Omega 3 (EPA + DHA 600 mg in a 2:1 ratio) daily for 4 years or Omega 3 + Vitamin B for 4 years	Omega 3 + Vitamin B for 4 years or Vitamin B for 4 years	4 years	Screening [F-TICS-m] Memory [F-TICS-m subscore] [F-TICS-m recall subscore]
Chew, 2015 ¹⁷ RCT USA High	3501	Adults at risk for developing macular degeneration Mean age (SD): 72.7 (± 7.7) years 57.5% female 97% white 29% ≤ high school 49% ≥ some college 22% postgraduate Mean TICS (SD): 33 (3.4)	Long-chain polyunsaturated fatty acids (1 g, specifically DHA 350 mg and EPA 650 mg) for 5 years	No long-chain polyunsaturated fatty acids (other groups) for 5 years	Yearly for 5 years	Screening [TICS total score] Composite [composite including all cognitive tests plus delayed recall of WMS-III recall paragraph] Executive/attention/processing speed [backwards counting] [verbal fluency – animal, letter & alternating – also Language] Memory [Wechsler logical memory I & II] [TICS word list recall] Language [verbal fluency – animal] [verbal fluency – letter] [verbal fluency – category]
Lutein/ Zeaxanthin						
Chew, 2015 ¹⁷ RCT USA High	3501	Adults at risk for developing age-related macular degeneration Mean age (SD): 72.7 (± 7.7) years	Lutein (10mg)/zeaxanthin (2mg) daily 5 years	No Lutein/zeaxanthin (other groups) for 5 years	Yearly for 5 years	Screening [TICS total score] Composite [composite including all cognitive tests plus delayed recall of WMS-III recall paragraph] Executive/attention/processing speed [backwards counting] [verbal fluency –

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cognition	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome Timing	Outcome Domain [Instrument]
		57.5% female 97% white 29% ≤ high school 49% ≥ some college 22% postgraduate Mean TICS (SD): 33 (3.4)				animal, letter & alternating – also Language] Memory [Wechsler logical memory I & II] [TICS word list recall] Language [verbal fluency – animal] [verbal fluency – letter] [verbal fluency – category]
Multi-nutraceutical supplement						
Bun, 2015 ¹⁸ Open label intervention study (observational) Japan High	825	People aged 65+ Mean age (SD): 72 (5) years 42% female Race not reported Mean education (SD): 10 (2.5) years Baseline cog exclusion score < 1.5 SD on ≥ 1 domain of the 5-cog test after adjustment	Nutritional supplementation (n-3 polyunsaturated fatty acid, Ginkgo biloba, leaf dry extracts, and lycopene) for 3 years	No nutritional supplementation (exercise and inactive control groups)	3 years	Diagnosis [diagnosis of AD]

Cognitive test abbreviations: 3MSE=Modified Mini Mental Status Examination; ADAS-Cog=Alzheimer's Disease Assessment Scale-Cognitive Subscale; AVLT=Auditory Verbal Learning Test; CVLT=California Verbal Learning Test; CANTAB=Cambridge Neuropsychological Test Automated Battery Paired Associated Learning Test; CANTAB PAL=Cambridge Neuropsychological Test Automated Battery Paired Associated Learning Test; CDR=Change in Dementia Rating; CERAD= Consortium to Establish a Registry for Alzheimer's Disease; COWA= Controlled Oral Word Association; F-TICS=French version, Telephone Interview Cognitive Status; HVLT-R=Hopkins Verbal Learning Test-Revised; MMSE=Mini-Mental State Examination; SWM=Spatial Working Memory; PRM=Pattern Recognition Memory; RT=reaction time; TICS=Telephone Interview Cognitive Status; TICS-m=Telephone Interview Cognitive Status-Modified; TMT=Trails Making Test (A & B); VRM=Verbal Recognition Memory; WAIS=Wechsler Adult Intelligence Scale; WMS= Wechsler Memory Scale

Omega 3 fatty acids: ALA=alpha-linolenic acid; DHA=docosahexaenoic acid; EPA=icosapentaenoic acid; Lc-n3-FA=long-chain omega-3 fatty acids

Other abbreviations: AD=Alzheimer's disease; DSM= Diagnostic and Statistical Manual of Mental Disorders (DSM); NINCDS-ADRDA=National Institute of Neurological and Communicative Disorders and Stroke-Alzheimer's Disease and Related Disorders Association; SD=Standard Deviation; RCT=Randomized Controlled Trial

Appendix Table H2. Summary risk of bias assessments: nutraceuticals interventions in adults with normal cognition

Study	Overall Risk of Bias Assessment	Rationale
Omega 3 fatty acids efficacy		
Cukierman-Yaffe, 2014 ¹	Medium	Attrition >20% at some time points; sensitivity analysis conducted
Witte, 2014 ²	Medium	Unclear randomization procedures; attrition >10% without analysis to account for possible bias
Stonehouse, 2013 ³	High	Attrition >20% without analysis to conduct for possible bias
Geleijnse, 2012 ⁴	Medium	Unclear randomization procedures; attrition
Andreeva, 2011 ⁵	Medium	Subset of RCT followup using participants with a history of cardiovascular disease. Original RCT baseline measures on subset – no differences between groups.
Dangour, 2010 ⁶	Medium	Attrition >10% without analysis to correct for potential bias
Yurko-Mauro, 2010 ⁷	Medium	Attrition >10% without appropriate analysis; possible detection bias (unclear whether assessor was independent)
Van de Rest, 2008 ⁸	Low	
Ginkgo biloba efficacy		
Lewis, 2014 ⁹	High	Attrition >25% without analysis
Vellas, 2012 ¹⁰	Medium	Attrition >30% (analysis conducted)
Snitz, 2009 ¹¹	Medium	High attrition, but analysis conducted to correct for potential bias
DeKosky, 2008 ¹²	Medium	Attrition >10% without analysis; possible detection bias (unclear outcome assessment blinding/independence)
Dodge, 2008 ¹³	Medium	Attrition >10% without analysis; possible detection bias (unclear outcome assessment blinding/independence)
Multi-nutraceutical efficacy		
Lewis, 2014 ⁹	High	Attrition >25% without appropriate analysis
Resveratrol efficacy		
Witte, 2014 ¹⁴	Medium	Unclear randomization procedures; unclear whether outcome assessor was blinded and independent
Red clover & black cohosh efficacy		
Maki, 2009 ¹⁵	High	Attrition >25% from original randomization without analysis to correct for potential bias
Plant sterols or plant stanols		
Schieper ¹⁶ s 2009	Medium	Unclear randomization procedures; unclear whether outcome assessor was blind to treatment
Comparative effectiveness		
Andreeva, 2011 ⁵ (Omega 3)	Medium	Subset of RCT followup using participants with a history of cardiovascular disease. Original RCT baseline measures on subset – no differences between groups.
Chew, 2015 ¹⁷ (Omega 3 & Lutein/Zeaxanthin)	High	Unclear randomization procedures; high attrition; reporting bias due to discrepancies in number randomized in 2 study papers
Bun, 2015 ¹⁸ (Multi-nutraceutical supplement)	High	Participants not randomized; high attrition

Appendix Table H3. Strength of evidence assessments: nutraceutical interventions in adults with normal cognition

Outcome	# Trials (n)	Evidence Summary Summary statistics [95% CI]	Study Limitations	Directness	Precision	Consistency	Reporting Bias	Optional Components	SOE
Omega 3 fatty acids versus inactive control									
Dementia	1 (12,536)	0 of 1 tests show statistically significant improvement with intervention <u>Cukierman-Yaffe 2014</u> Hazard ratio for incident cognitive impairment (composite of either incident dementia diagnosis or follow-up MMSE <24): 0.93 [0.86 to 1.0]	High	Direct	Precise	Unknown	Undetected	N/A	Low (due to study limitation of composite outcome with component of unequal importance, one of which is not clinical diagnosis and may be achieved due to chance)
MCI		NR							Insufficient
Biomarkers	Single trial <500 participants	Limited Data							Insufficient
Brief cognitive test performance (6 months to 6 years)	4 (16,431)	0 of 9 tests show statistically significant improvement with intervention (no differences between groups) Cukierman-Yaffe, 2014 ¹ Rate of change from baseline MMSE: 0.0013	Medium	Indirect	Imprecise	Consistent	Undetected	NA	Low

Appendix I. Diet Interventions

Appendix Table I1. Characteristics of eligible studies: nutrition/lifestyle interventions in adults with normal cognition

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex Race Education Baseline Cog	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
Caloric restriction diet interventions						
Martin 2007 ¹ RCT USA High	48	Overweight adults aged 25 to 50 with a BMI ≤ 25 and < 30 Mean age: 38 56% Female 63% White Education: NR Baseline cog: NR	1) calorie restriction (25% calorie restriction based on baseline energy requirements); food provided at a center weeks 1-12, and 22-24, diets self-selected in weeks 13-22 2) calorie restriction + structured exercise (12.5% calorie restriction + 12.5% increase in energy expenditure via structured exercise) 3) very low-calorie diet (890 kcal/d liquid formula diet until 15% of body weight is lost, followed by weight maintenance)	Weight maintenance diet	6 months	Executive/attention/processing speed [Conners' CPT-II] Memory [RAVLT] Memory [ACT] Memory [BVRT]
Energy restriction diet interventions						
Napoli 2014 ² RCT Italy Medium	107	Obese (BMI ≥ 30), sedentary adults with stable body weight aged ≥ 65 Mean age: 70 Sex: 63% Female Race: 85% White Mean education: 16	1) Diet: calorie restriction; counseling; goal setting; 10% weight loss with maintenance 2) Exercise: counseled on weight maintenance; multicomponent exercise 3 times/week	Information control: general nutrition information; instructed not to make changes to daily routine	1 year	Global Function [3MS] Executive/attention/processing speed [Trail Making Test A] Executive/attention/processing speed [Trail Making Test B] Language [Word List Fluency]

		years Baseline cognition:	3) Diet + Exercise: both interventions			
Brinkworth 2009 ³ RCT Australia High	118	Adults aged 24 to 64 years with abdominal obesity and at least 1 additional metabolic syndrome risk factor Mean age: 50 Sex: NR Race: NR Education: NR Mean 3MS (SE): 96.3 (0.8) control 96 (0.6) diet only 95.6 (0.8) diet-exercise	Energy-restricted, planned, isocaloric, very low carbohydrate, high fat (LC) diet	High-carbohydrate, low-fat diet with individual counseling for first 8 weeks.	1 year	Executive/attention/processing speed [Digit Span Backward] Executive/attention/processing speed [Inspection Time]
Mediterranean Diet interventions						
Valls-Pedret 2015 ⁴ PREDIMED RCT Spain High	447	Adults aged 55 to 80 with no cardiovascular disease, but high vascular risk Mean age: 67 51% Women Mean education: 7 years Baseline global cog: NR	1) Mediterranean Diet high consumption plant-based foods, fish and seafood; low consumption of dairy, meat, processed grains; regular moderate alcohol (red wine with meals preferred) plus extra-virgin olive oil 2) Mediterranean Diet + mixed nuts	Information control (leaflet about low-fat diets)	5 years	Global Function [MMSE] Memory [RAVLT, total learning and delayed recall] Executive/attention/processing speed [Digit Span Forward] Executive/attention/processing speed [Digit Span Backward] Executive/attention/processing speed [Color Trail Test Part 1] Executive/attention/processing speed [Color Trail Test Part 2] Memory [Verbal Paired Associates] Language [Verbal Fluency]
Martinez-Lapiscina 2013(a) ⁵ PREDIMED RCT Spain High	1055	Adults aged 55 to 80 with no cardiovascular disease, but high vascular risk Mean age: 67 55% Female Race: NR Education: >8 years: 29% Baseline global cog: NR	1) Mediterranean Diet high consumption plant-based foods, fish and seafood; low consumption of dairy, meat, processed grains; regular moderate alcohol (red wine with meals preferred) plus extra-virgin olive oil 2) Mediterranean Diet + mixed nuts	Information control (leaflet about low-fat diets)	6.5 years	Diagnosis [Incidence of MCI] Global Function [MMSE] Visuospatial [Clock Drawing Test]

Martinez-Lapiscina 2013(b) ⁶ PREDIMED (subgroup) RCT Spain High	285	Adults aged 55 to 80 with no cardiovascular disease, but high vascular risk Mean age: 67 55% Female Race: NR Mean education: 9 years Baseline global cog: NR	1) Mediterranean Diet high consumption plant-based foods, fish and seafood; low consumption of dairy, meat, processed grains; regular moderate alcohol (red wine with meals preferred) plus extra-virgin olive oil 2) Mediterranean Diet + mixed nuts	Information control (leaflet about low-fat diets)	6.5 years	Diagnosis [Incidence of MCI] Global Function [MMSE] Executive/attention/processing speed [Trail Making Test A] Executive/attention/processing speed [Trail Making Test B] Executive/attention/processing speed [Digit Span Forward] Executive/attention/processing speed [Digit Span Backward] Memory [RAVLT, immediate and delay] Memory [Verbal Paired Associates] Memory [Rey-Osterrich Complex Figure, immediate and delayed] Language [Similarities] Language [Semantic Verbal Fluency Test-Animals] Language [Phonemic Verbal Fluency Test] Language [Boston Naming Test] Visuospatial [Clock Drawing Test] Visuospatial [Rey-Osterrich Complex Figure, copy]
Protein supplement interventions						
van der Zwaluw 2014 ^{7,8} RCT Netherlands Medium	65	Elderly adults aged ≥65 and an elevated plasma Hcy level (12-50 μmol/L) Mean age: 80 55% Female Education: Low: 9% (protein) and 0% (placebo) Middle: 59% (protein) and 55% (placebo) High: 32% (protein) and 45% (placebo) Mean MMSE (IQR): 29 (26-30) protein 28 (26-30) placebo	Protein drink (15mg of protein) twice daily	Placebo drink	24 weeks	Global Function [MMSE] Memory [Word Learning Test] Executive/attention/processing speed [Digit Span Forward] Executive/attention/processing speed [Digit Span Backward] Executive/attention/processing speed [Trail Making Test A] Executive/attention/processing speed [Trail Making Test B] Executive/attention/processing speed [Stroop Color Word Test] Executive/attention/processing speed [Symbol Digit Modalities] Executive/attention/processing speed [Reaction Time test] Language [Letter Fluency]

Appendix Table J3. Summary risk of bias assessments: multimodal interventions in adults with normal cognition

Study	Overall Risk of Bias Assessment	Rationale
Clare 2015 ⁸	Medium	Potential performance and detection bias.
Eggenberger 2015 ¹²	Medium	Attrition rate is 20% with potential performance bias.
Ngandu 2015 ⁶	Low	No significant risk of bias detected.
Hars 2014 ³	Medium	Process for randomization is unclear and attrition rate is 16%.
Lee 2014 ¹⁰	High	High potential for bias due to over 50% attrition.
McDaniel 2014 ¹³	High	Process for randomization is unclear with suspected reporting bias.
Napoli 2014 ¹	Medium	Process for randomization is unclear and 13% attrition rate.
van de Rest 2014 ⁷	Medium	Attrition is 15% with potential reporting bias.
Clark 2012 ⁹	High	Attrition rate is greater than 21% with no analysis to address potential bias.
Tesky 2011 ⁴	High	Attrition rate is greater than 21% with no analysis to address potential bias.
Carlson 2008 ⁵	High	Attrition rate is greater than 21% with no analysis to address potential bias.
Yesavage 2008 ¹¹	High	Attrition rate is greater than 21% with no analysis to address potential bias.
Martin 2007 ²	Medium	Process for attrition is unclear with potential detection bias.

Appendix Table J8. Summary Risk of Bias Assessments: Multimodal interventions in adults with MCI

Study	Overall Risk of Bias Assessment	Rationale
Lam 2015 ¹⁶	High	Attrition rate is higher than 21% with no analysis to address potential bias.
Fiatarone Singh 2014 ¹⁴	High	Suspected reporting bias. Results for intervention arms are combined in the analysis,
Johari 2014 ¹⁵	High	Process for randomization not described, potential detection bias, and potential performance bias due to concurrent intervention.

Appendix Table L3. Summary risk of bias assessments: vitamins in adults with normal cognition

Study	Overall Risk of Bias Assessment	Rationale
Multivitamins		
Chew 2015 ¹	High	Randomization methods unclear, reported attrition (19%) conflicting with related publication, concurrent intervention not controlled for.
Grodstein 2013 ²	Medium at followup 2 High at followup 3+	Randomization and blinding methods adequate, attrition 11% at second followup (medium), 31% at third followup (high) and 60% and final followup (high) with no missing data imputation, independent outcome assessor unclear.
Kesse-Guyot 2006 ³	High	Randomization unclear, attrition 35% with no missing data imputation.
McNeill 2007 ⁴	Low-medium	Randomization and blinding methods adequate, attrition unclear but likely 15%, ITT, all outcomes reported.
Wolters 2005 ⁵	Low-medium	Randomization and blinding methods unclear, comparable outcome assessment timing between groups, blinding likely adequate, concurrent interventions unclear.
Heart Protection Study 2002 ^{16,17}	Medium	Randomization methods adequate, attrition unclear but used survival analyses, outcome assessor blinding and independence unclear, ITT.
Smith 1999 ⁶	High	Randomization methods unclear, attrition not reported, blinding methods adequate, ITT not reported.
Vitamin B		
van der Zwaluw 2014 ^{18,19}	Low-medium	Randomization methods adequate, attrition 24% with no missing data imputation, outcome assessor not independent, all outcomes reported.
Walker 2012 ⁸	Low-medium	Randomization methods adequate, blinding unclear, attrition 16% at two year followup and no missing data imputation, outcome assessor independence unclear.
Andreeva 2011 ⁹	Low-medium	Adequate randomization and blinding, low attrition in this followup study, ITT.
Brady 2009 ¹⁰	High	Attrition 25-27% and no missing data imputation.

Study	Overall Risk of Bias Assessment	Rationale
McMahon 2006 ¹¹	Low-medium	Randomization and blinding methods adequate, outcome assessor independence unclear, ITT not reported.
Vitamin E		
Kang 2009 ¹²	Low-medium at followup 3 High at final followup	Attrition 12% at third followup (medium) and 20% by final followup (high), outcome assessment timing not comparable between groups, ITT unclear.
Kang 2006 ¹³	Low-medium	Randomization unclear, attrition 20% and no missing data imputation, outcome assessment timing unclear.
Carlsson 2002 ¹⁵	Medium	Randomization and blinding methods unclear, adequate outcome assessment tools, ITT.
Vitamin C		
Kang 2009 ¹²	Low-medium at followup 3 High at final followup	Attrition 12% at third followup (medium) and 20% by final followup (high), outcome assessment timing not comparable between groups, ITT unclear.
Vitamin D + Calcium		
Rossom 2012 ¹⁴	Low-medium at followup 7 High at followup 8	Randomization and blinding methods adequate, outcome assessor independent, ITT, all outcomes reported.
Beta carotene		
Kang 2009 ¹²	Low-medium at followup 3 High at final followup	Attrition 12% at third followup (medium) and 20% by final followup (high), outcome assessment timing not comparable between groups, ITT unclear.

Appendix Table L7. Summary risk of bias assessments: vitamins in adults with MCI

Study	Overall Risk of Bias Assessment	Rationale
Multivitamins		
Naeini 2014 ²⁰	Low-medium	Randomization methods unclear, blinding methods adequate, attrition low, ITT not reported.
Vitamin B		
Remington 2015 ²¹	High	Randomization methods unclear, attrition 45% at 6 month followup with no missing data imputation.
Douaud 2013 ²⁴	Low-medium	Randomization and blinding methods adequate, attrition low, all outcomes reported.
de Jager 2012 ²³	Low-medium	Randomization methods adequate, attrition 16% for cognitive outcomes and no missing data imputation, blinding methods likely adequate, all outcomes reported.
Smith 2010 ²²	Low-medium	Randomization and blinding methods adequate, attrition low for primary outcome and medium for secondary outcomes, ITT, comparable outcome assessment timing between groups.
Vitamin E		
Petersen 2005 ²⁵	Low-medium	Randomization and blinding methods adequate, attrition 30% but performed appropriate sensitivity analyses, ITT.

Appendix Table L8. Strength of evidence assessments: vitamins vs. inactive control in adults with MCI

Outcome	# Trials (n)	Evidence Summary Summary statistics [95% CI]	Study Limitations	Directness	Precision	Consistency	Reporting Bias	Optional Components	SOE
Vitamin E vs. placebo k=1; n=516									
Dementia 3 years	1 (516)	2 tests showed no statistically significant decrease in diagnosis of Alzheimer's disease with vitamin E, Diagnosis, between groups probability of progression to Alzheimer's disease HR=1.02 [0.74 to 1.41] p=0.91 CDR sum of boxes, between groups change from baseline (z-score)* 0.03 [NR] p>0.1	Medium	Direct	Imprecise	Consistent	Undetected	NA	Low
Brief Cognitive Test Performance	1 (516)	1 test showed no statistically significant improvement with vitamin E MMSE, between groups change from baseline (z-score)* 0.55 [NR] p>0.1	Medium	Indirect	Imprecise	Unknown	Undetected	NA	Insufficient
Multidomain Neuropsychological Performance	1 (516)	1 test showed no statistically significant improvement with vitamin E ADAS-Cog, between groups change from baseline (z-score)* 0.85 [NR] p>0.1	Medium	Indirect	Imprecise	Unknown	Undetected	NA	Insufficient

Appendix M. Antihypertension Treatment

Appendix Table M1. Characteristics of eligible studies: antihypertension interventions in adults with normal cognition

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex (% female) Race (% White) Education (mean years) Baseline Cog	Intervention (INT) Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome measurement timing	Outcome (Instrument)
Efficacy						
<i>ACE and Thiazide k = 2</i>						
Peters 2008 ¹ (HYVET- COG) RCT Multinational Medium	3,845	Adults aged ≥80 years with an average sitting systolic blood pressure between 160 mmHg and 200 mmHg and an average standing systolic blood pressure ≥140 mmHg, and a sitting diastolic blood pressure of ≤110 mmHg. Normal cognition. Mean age (SD): 83.5 (3.1) 61% Female Race: NR 27% no education 28% primary education 29% secondary education 12% higher education 3% more than higher education Median MMSE (range): 26 (15 – 30)	Indapamide 1.5 mg with optional perindopril (2mg up to 4 mg)	Matching-placebo	2.2 years mean follow up	Diagnosis [committee-reported diagnosis of dementia] Global cognition Screening [MMSE, cognitive decline defined as MMSE <24 or a decline of >3 MMSE points in a year] Adverse events [number of events]
ADVANCE Collaborative Group 2007 ² RCT Multinational Low	11,140	Adults diagnosed with type 2 diabetes at the age ≥30 years, and were aged ≥55 years at study entry. Patients also need to have a history of cardiovascular disease or at risk for cardiovascular disease. Normal cognition.	Combined perindopril (2 mg up to 4 mg) and indapamide (0.625 mg up to 1.25 mg) and open label perindopril up to 4 mg	Matching-placebo and open label perindopril up to 4 mg.	4.3 years mean follow up	Diagnosis Global cognition Screening [MMSE] Adverse Events [number with serious drug reactions]

		Mean age (SD): 66 (7) 43% Female Race: NR Education: NR Median MMSE (range): NR				
<i>ARB</i> <i>k = 3</i>						
Anderson 2011 ³ (TRANSCEND trial) RCT Multinational Medium	5926	Adults aged ≥55 years with evidence of coronary artery, peripheral vascular, or cerebrovascular disease or diabetes with end-organ damage, intolerance to ACE inhibitors, and normal cognition. Mean age (SD): 66.9 43% Female 61% European ethnic origin 62% ≥9 years of education Median MMSE (IRQ): 29 (27 – 30)	Telmisartan 80 mg daily	Placebo daily	56 months median follow up	Global Cognition Screening [cognitive decline - drop of 3 or more MMSE points]
Saxby 2008 ⁴ (single center in SCOPE trial) RCT United Kingdom Medium	257	Hypertensive adults aged 70 to 89 years with systolic blood pressure of 160 to 179 mmHg and diastolic blood pressure of 90 to 99 mmHg and normal cognition. Mean age (SD): 76 (4) 54% Female Race: NR Mean years education (SD): 10 (2) Mean MMSE (SD): 29 (1)	Candesartan (8 mg – 16 mg) daily with hydrochlorothiazide 12.5 mg added as needed. When target blood pressure not achieved (<160/90 mmHg) other drugs added as needed.	Placebo daily and hydrochlorothiazide 12.5 mg added as needed. When target blood pressure not achieved (<160/90 mmHg) other drugs added as needed.	44 months mean follow up	Global Cognition Screening [MMSE] Executive/attention/processing speed [processing speed composite measure, attention composite measure, executive function composite measure] ^a Memory [episodic memory composite measure, working memory composite measure] ^a
Lithell 2003 ⁵ Skoog 2005 ⁶ (SCOPE trial) RCT Multinational Medium	4937	Hypertensive adults aged 70 to 89 years with systolic blood pressure of 160 to 179 mmHg and diastolic blood pressure of 90 to 99 mmHg and normal cognition with results stratified by low (MMSE 24 – 28) and high (29 – 30) cognitive function. Mean age (SD): 76 (NR) 64% female Race: NR	Candesartan (8mg – 16 mg) daily with hydrochlorothiazide 12.5 mg added as needed. When target blood pressure not achieved (<160/90 mmHg) other drugs added as needed.	Placebo daily and hydrochlorothiazide 12.5mg added as needed. When target blood pressure not achieved (<160/90 mmHg) other	44 months mean follow up	Diagnosis Global Cognition Screening [MMSE]

		10% less than primary school education 44% primary school education 40% more than primary school education 6% University education Mean MMSE (SD): 28.5 (NR)		drugs added as needed.		
<i>Beta Blocker</i>						
Perez-Stable 2000 ⁷ RCT United States High	312	Adults aged 18 to 59 with diastolic blood pressure between 90 and 104 mmHg and normal cognition.	Propranolol (40 mg first three days then 80 mg daily as tolerated then increased up to 400 mg daily)	Placebo daily	12 months	Executive/attention/processing speed [Stimulus Evaluation/Response Selection, Continuous Performance Task, Digit Symbol Substitution Task] Memory [California Verbal Learning Test]
Bird 1990 ^{8,9} RCT United Kingdom Medium	2401	Adults aged 65 to 74 with systolic blood pressure of 160 to 209 mmHg and diastolic blood pressure of <114 mmHg, and normal cognition. Mean age (SD): 70.3 (2.7) 58% Female Race: NR Education: NR Cognition: NR	Atenolol 50 mg daily	Placebo daily	9 months	Executive/attention/processing speed [Trail Making Test] Memory [Paired Associated Learning Test]
<i>Combination therapy</i>						
Forette 2002 ¹⁰ (Syst-Eur trial 1 & 2) RCT and open-label follow up Multinational Medium	3228	Adults aged >60 years with systolic blood pressure of 160 to 219 mmHg and diastolic blood pressure <95 mmHg and normal cognition. Median age (range): 68 (60-92) Sex: NR Race: NR Mean age (SD) on leaving school: 16.7 (4.5) Cognition: NR	Antihypertensive stepwise therapy with titration with goal of lowering systolic blood pressure by 20 mmHg or below 150 mmHg (step 1: nitrendipine 10 -40 mg daily; step 2: enalapril 5 – 20 mg daily; step 3: hydrochlorothiazide 12.5 – 25 mg daily)	Placebo daily (in open-label phase offered active treatment)	3.9 years median follow up	Diagnosis Global Cognition Screening [MMSE]
Forette 1998 ¹¹ (Syst-Eur trial 1) RCT Multinational	3162	Adults >60 years with systolic blood pressure of 160 to 219 mmHg and diastolic blood pressure <95 mmHg and normal cognition.	Antihypertensive stepwise therapy with titration with goal of lowering systolic blood pressure by 20	Placebo daily	2 years median follow up	Diagnosis Global Cognition Screening [MMSE]

Medium		Mean age (SD): 69.9 (6.4) Sex: NR Race: NR Mean age (SD) on leaving school: 16.2 (4.4) Median MMSE (range): 29 (15-30)	mmHg or below 150 mmHg (step 1: nitrendipine 10 -40 mg daily; step 2: enalapril 5 – 20 mg daily; step 3: hydrochlorothiazide 12.5 – 25 mg daily)			
Applegate 1994 ^{12, 13} (SHEP trial) RCT United States High	4736	Adults >60 years with systolic blood pressure of 160 to 220 mmHg and diastolic blood pressure <90 mmHg and normal cognition. Mean age (range): 72 (60 – 94) 57% Female 86% White Mean years of education (SD): 11.7 (NR) 0.4% Evidence of cognitive impairment	Step therapy: step 1: chlorthalidone (12.5 – 25 mg); step 2: atenolol (25 – 50 mg) or reserpine (0.05 – 0.1 mg).	Placebo daily	5 year average follow up	Diagnosis Global Cognition Screening [SHORT-CARE Dementia] Executive/attention/processing speed [Digit Symbol] Memory [Addition Test Finding A's Test, Delayed Recognition Span Test] Language [Boston Naming Test] Visuospatial [Letter Sets Test]
Gurland 1988 ¹⁴ (SHEP feasibility trial) RCT United States Medium	551	Adults >60 years with systolic blood pressure >160 mmHg and diastolic blood pressure <90 mmHg and normal cognition. Mean Age: NR Sex: NR 83% White Education: NR Cognition: NR	Step therapy: step 1: chlorthalidone; step 2: reserpine, metoprolol, or hydralazine)	Placebo	1 year	Diagnosis Executive/attention/processing speed [Trail Making, Digit Symbol, composite battery ^b]
<i>Comparative Effectiveness ARB versus ACE</i>						
Hajjar 2013 ¹⁵ RCT United States Medium	53	Adults aged ≥60 years with systolic blood pressure ≥140 mmHg or diastolic blood pressure ≥90 mmHg or receiving antihypertensive medications and normal cognition. Mean age (SD): 72 (7) 57% Female 70% White 19% ≤High school	I ₁ :Lisinopril 10 mg with titration to 40 mg I ₂ : Candesartan 8 mg with titration to 32 mg I ₃ : Hydrochlorothiazide 12.5 mg with titration to 25 mg If systolic blood		6 months	Executive/attention/processing speed [Trail Making Tests, Digit Span Test] Memory [Hopkins Verbal Learning Tests-Revised] Adverse Events [Hospitalizations]

		Mean MMSE (SD): 26 (2)	pressure of less than 140 mmHG and diastolic blood pressure of less than 90 mmHG not get then long-acting nifedipine (30 mg increased to 90 mg) was added followed by long-acting metoprolol (12.5 mg to 50 mg).			
Anderson 2011 ³ (ONTARGET trial) RCT Multinational Medium	17118	Adults aged ≥55 with evidence of coronary artery, peripheral vascular, or cerebrovascular disease or diabetes with end-organ damage, and normal cognition. Mean age (SD): 66 (7.2) 27% Female 73% European ethnic origin 67% ≥ 9 years of education Median MMSE (IRQ): 29 (27 – 30)	Ramipril 5mg (increased to 10 mg after 2wks) daily	Telmisartan 80 mg daily	56 months median follow up	Global Cognition Screening [cognitive decline - drop of 3 or more MMSE points]
Forgari 2006 ¹⁶ RCT open-label Italy Low	160	Adults aged 61 to 75 with systolic blood pressure >140 mmHg diastolic blood pressure ≥95 and <110 mmHg, and normal cognition. Mean age (SD): 68 (5.5) 54% Female Race: NR Education: NR Cognition: NR	Telmisartan 80 mg and hydrochlorothiazide 12.5 mg daily	Lisinopril 20 mg and hydrochlorothiazide 12.5mg daily	6 months	Executive/attention/processing speed [Trail Making B] Memory [Word-list Memory Test, Word-list Recall Test, Word-list Recognition Test] Language [Boston Naming Test, Name Animals]
<i>Comparative Effectiveness ARB versus Thiazide</i>						
Hajjar 2013 ¹⁵ RCT United States Medium	53	Adults aged ≥60 years with systolic blood pressure ≥140 mmHg or diastolic blood pressure ≥90 mmHg or receiving antihypertensive medications and normal cognition. Mean age (SD): 72 (7)	l ₁ :Lisinopril 10 mg with titration to 40 mg l ₂ : Candesartan 8 mg with titration to 32 mg l ₃ : Hydrochlorothiazide 12.5 mg with titration		6 months	Executive/attention/processing speed [Trail Making Tests, Digit Span Test] Memory [Hopkins Verbal Learning Tests-Revised] Adverse Events [Hospitalizations]

		57% Female 70% White 19% ≤High school Mean MMSE (SD): 26 (2)	to 25 mg If systolic blood pressure of less than 140 mmHG and diastolic blood pressure of less than 90 mmHG not get then long-acting nifedipine (30 mg increased to 90 mg) was added followed by long-acting metoprolol (12.5 mg to 50 mg).			
Tedesco 1999 ¹⁷ RCT Italy Low	69	Adults aged 30 to 73 with mild-to-moderate essential hypertension: diastolic blood pressure of 90 to 114 mmHg and normal cognition. Mean age (SD): 55 (11) 48% Female Race: NR Mean years education (SD): 9.1 (4) Mean MMSE (SD): 23 (3)	Losartan 50 mg daily	Hydrochlorothiazide 25 mg daily	26 months	Global Cognition Screening [MMSE]
<i>Comparative Effectiveness – Unique comparisons</i>						
Williamson 2014 ¹⁸ (ACCORD BP trial) RCT United States Medium	1439	Middle-aged and older adults with diabetes at high risk of cardiovascular events and systolic blood pressure of 130 to 180 mmHg and normal cognition. Mean age (SD): 62 (5.8) 55% Female 66% White 13% <High school 26% High school graduate 36% Some college 25% college graduate or more Median MMSE (25 th and 75 th percentile): 28 (26-29)	Intensive intervention (systolic blood pressure <120 mm Hg)	Standard therapy (systolic blood pressure <140 mm Hg)	40 months	Global Cognition Screening [MMSE] Executive/attention/processing speed [modified Stroop Color-Word Test, Digit Symbol Test] Memory [Rey Auditory Verbal Learning]
Hajjar 2013 ¹⁵	53	Adults aged ≥60 years with	l1:Lisinopril 10mg with		6 months	Executive/attention/processing speed [Trail

RCT United States Medium		systolic blood pressure ≥ 140 mmHg or diastolic blood pressure ≥ 90 mmHg or receiving antihypertensive medications and normal cognition. Mean age (SD): 72 (7) 57% Female 70% White 19% \leq High school Mean MMSE (SD): 26 (2)	titration to 40 mg I ₂ : Candesartan 8 mg with titration to 32 mg I ₃ : Hydrochlorothiazide 12.5mg with titration to 25 mg If systolic blood pressure of less than 140 mmHG and diastolic blood pressure of less than 90mmHG not get then long-acting nifedipine (30 mg increased to 90 mg) was added followed by long-acting metoprolol (12.5 mg to 50 mg).			Making Tests, Digit Span Test]] Memory [Hopkins Verbal Learning Tests-Revised] Adverse Events [Hospitalizations]
Sato 2013 ¹⁹ (CAMUI trial) RCT open-label Japan Low	142	Hypertensive adults aged ≥ 65 years that had not attained the blood pressure goal (systolic blood pressure < 140 mmHg and or diastolic blood pressure > 90 mmHg) with monotherapy with typical dosage of ARB and normal cognition. Mean age (SD): 74 (6.2) Sex: NR Race: NR Education: NR Mean MMSE (SD): 26.7 (3)	Combined losartan 50mg and hydrochlorothiazide 12.5 mg daily in quarterly visits if blood pressure goals not obtained titration was undertaken	Combined amlodipine 5mg and typical dosage of a angiotensin receptor blocker daily during quarterly visits if blood pressure goals not obtained titration was undertaken	12 months	Global Cognition Screening [MMSE]
Anderson 2011 ³ (ONTARGET trial) RCT Multinational Medium	17078	Adults aged ≥ 55 years with evidence of coronary artery, peripheral vascular, or cerebrovascular disease or diabetes with end-organ damage, and normal cognition. Mean age (SD): 66 (7.2) 27% Female 73% European ethnic origin 67% ≥ 9 years of education Median MMSE (IRQ): 29 (27 – 30)	Ramipril 5mg (increased to 10mg after 2wks) daily	Combined ramipril 5 mg (increased to 10mg after 2wks) daily and telmisartan 80 mg daily	56 months median follow up	Global Cognition Screening [cognitive decline - drop of 3 or more MMSE points]

Forgari 2003 ²⁰ RCT Italy Low	120	Adults aged 75 to 89 with mild to moderate essential hypertension: systolic blood pressure <200 mmHg and diastolic blood pressure of 90 to 105 mmHg. Normal cognition. Mean age (SD): 83 (4.3) 56% Female Race: NR Mean years education (SD): 8.6 (4.1) Cognition: NR	Atenolo 50 mg with titration to 100 mg	Losartan 50 mg with titration to 100 mg	6 months	Memory [Word-list Test, Memory Word Recall Test] Language [Word-list Frequency] Adverse Events
Yodfat 1996 ²¹ RCT Israel Low	368	Males aged 40 to 65 with essential hypertension: diastolic blood pressure of 95 to 105 mmHg. Normal cognition. Mean age (SD): 52 (7.6) 100% Male Race: NR Education: NR Cognition: NR	I ₁ : Isradipine 1.25 mg twice a day (dose doubled if normotension not achieved at 4 weeks and if normotension not achieved at 6 weeks captopril 25mg daily) I ₂ : Methyl dopa 250 mg twice a day (dose doubled if normotension not achieved at 4 weeks and if normotension not achieved at 6 weeks captopril 25 mg daily)	placebo twice a day	12 months	Language [Semantic Memory] Adverse Events [life-threatening events, adverse reaction]
Bird 1990 ⁸ RCT United Kingdom Medium	2446	Adults aged 65 to 74 with systolic blood pressure of 160 to 209 mmHg and diastolic blood pressure of <114 mmHg, and normal cognition. Mean age (SD): 70.3 (2.7) 58% Female Race: NR Education: NR Cognition: NR	I ₁ : Atenolol 50mg daily I ₂ : Moduretic (hydrochlorothiazide 25mg and amiloride 2.5mg) daily	Placebo	9 months	Executive/attention/processing speed [Trail Making Test] Memory [Paired Associated Learning Test]
Goldstein 1990 ²² RCT United States	690	Men aged >60 with mild-to-moderate hypertension and normal cognition.	Hydrochlorothiazide 25mg once or twice a day if target blood pressure not	Hydrochlorothiazide 50mg once or twice a day if target blood	1 year	Executive/attention/processing speed [Trail Making Test, Symbol digit, Time Estimation, Digit Span] Memory [Benton Visual Retention Test,

High		Mean Age: NR 100% Male Race: NR Mean years of education (SD): 10.6 (NR) Cognition: NR	achieved (<90 mmHg and ≤5 mmHg decline from baseline) randomly assigned to additional therapy (hydralazine 50-200 mg daily, methyldopa 550-2,000 mg daily, metoprolol 100-400 mg daily, and reserpine 0.05-0.25mg daily).	pressure not achieved (<90 mmHg and ≤5 mmHg decline from baseline) randomly assigned to additional therapy (hydralazine 50-200mg daily, methyldopa 550-2,000 mg daily, metoprolol 100-400 mg daily, and reserpine 0.05-0.25mg daily).		Immediate and Delayed Logical Memory, Paired Associate Learning, 3-word short-term memory, complex cognition composite, memory composite] Language[Token Test, Controlled word production] Motor [Halstead Finger Tapping, motor speed composite] Visuospatial [Hooper Visual Organization]
------	--	--	--	--	--	--

^a Saxby 2008⁴ evaluated a composite measures of episodic memory (composed of immediate word recall, immediate word recognition, delayed word recognition, picture recognition), attention (composed of simple reaction time, number vigilance, choice reaction time), working memory (composed of spatial memory, numeric working memory), speed of cognition (composed of reaction time scores from episodic memory recognition tasks, attention, and working memory tasks), and executive function (composed of trail making A & B, verbal fluency for letters F, A, and S, verbal fluency for category animals).

^b Gurland 1988¹⁴ evaluated a composite executive/attention/processing speed measure composed of SHORT-CARE dementia, Trail Making, and Digit Symbol test.

MMSE= Mini Mental Status Exam; NR=not reported; RCT=randomized controlled trial; SD=Standard Deviation; TMT=Trails Making Test

<i>Statins Versus Placebo</i>						
Trompet 2010 ¹ RCT Multinational High	5804	Adults aged 70 to 82 years with preexisting vascular disease or at increased risk of vascular disease and normal cognition. Mean age (SD): 75 (3) 52% Female Race: NR Mean years of education (SD): 15.1 (2) Mean MMSE (SD): 28 (1.5)	Pravastatin	Placebo	42 months mean follow up	Global Cognition Screening [MMSE] Executive/attention/processing speed [Stroop-Color-Word Test, Letter-Digit Coding Test] Memory [15-Picture Learning test immediate and delayed]

Parale 2006 ² Observational India High	97	Adults age ≥40 years with cardiovascular indications for statin use and normal cognition. Mean age (SD): 56.5 (8) 67% Female Race: NR Mean years education (SD): 11 (2.9) Mean MMSE (SD): 28.4 (1.8)	Atorvastatin 10 mg daily	Placebo	6 months	Global Cognition Screening [MMSE] Executive/attention/processing speed [Digit Symbol, Digit Span, Digit Vigilance, Trail Making B] Memory [Picture-Word Learning, Controlled Oral Word Association Test, Auditory Vigilance] Adverse Events
Muldoon 2004 ³ RCT United States Medium	308	Adults aged 35 to 70 years with low-density lipoprotein cholesterol level between 160 and 220 mg/dL and normal cognition. Mean age (SD): 53.7 (9.1) 52% Female 86% White Mean years education (SD): 14.8 (3.4) Mean Digit Vigilance (errors), and Recurring Words (errors): 6.6, 81.84.	Simvastatin 10 mg daily or Simvastatin 40 mg daily	Placebo	6 months	Executive/attention/processing speed ^a [composite executive/attention/processing speed 1] Memory [memory composite 1, memory 2] Adverse Events
Heart Protection Study 2002 ⁴ RCT United Kingdom Medium	20,536	Adults aged 40-80 years with total cholesterol concentrations ≥ 135 mg/dL and with substantial 5-risk of death from coronary heart disease and normal cognition. 28% > 70 years 28% Female Race: NR Education: NR Mean TICS-M (SD): 24.07 (NR)	Simvastatin 40 mg daily	Matching-placebo	5 years mean follow up	Diagnosis Global cognition Screening [Telephone Interview for Cognitive Status TICS-m] Adverse Events [hospitalizations]
Muldoon 2000 ⁵ RCT United States	209	Adults aged 24 to 60 with hypercholesterolemia (serum low-density-lipoprotein cholesterol level ≥160 md/dL) and normal cognition.	Lovastatin 20 mg daily	Matching placebo	6 months	Executive/attention/processing speed ^b [composite measure of attention, composite of mental flexibility, composite measure of psychomotor speed]

Medium		Mean age (SD): 46.4 (8.9) 46% Female 88% White Mean years education (SD): 15 (3) Mean Digit Span (SD), Digit Symbol (SD), Trailing Making B (SD): 7 (1.3), 11.8 (2.5), 65 (21).				Executive/attention/processing speed ^b Memory [working memory composite, memory retrieval composite]
Santanello 1997 ⁶ RCT United States Medium	431	Adults aged ≥65 years with low-density lipoprotein-cholesterol >159 md/dL and < 221 mg/dL and normal cognition and MMSE ≥ 24. Mean age (SD): 71.2 (NR) 71% Female 24% White Education: NR Mean Digit Symbol Substation Score (SD): 41.86 (13.88)	(I ₁) lovastatin 20 mg daily (I ₂) lovastatin 40 mg daily	Placebo	6 months	Executive/attention/processing speed [Digit Symbol Substitution Task] Adverse Events [number of events]
<i>Statin Plus Ezetimibe Versus Placebo</i>						
Tendolkar 2010 ⁷ RCT Netherlands Low	34	Elderly stroke-free patients with chronic or paroxysmal atrial fibrillation and normal cognition. Mean age (SD): 74 (4) 24% Female Race: NR Education: NR Mean MMSE (SD): 27.4 (2)	Atorvastatin 20mg for 2 weeks then increased to 40mg, after 4 weeks ezetimibe 10mg was added. Standard anticoagulant therapy	Matching-placebo and standard anticoagulant therapy	1 year	Global Cognition Screening [MMSE] Executive/attention/processing speed [Digit Symbol Substitution Test, Memory [Dutch modified version of the Rey Audulatory Verbal Learning Test, Immediate and delayed word recall] Biomarker [Brain Volume Change]
<i>Statin Plus Fenofibrate Versus Statin Plus Placebo</i>						
Willamson 2014 ⁸ (ACCORD Lipid trial) RCT United States Medium	1538	Middle-aged and older adults with diabetes at high risk of cardiovascular events with low-density lipoprotein cholesterol levels of less than 100 mg/dL and normal cognition. Mean age (SD): 62.5 (5.7)	Fenofibrate plus statin	Placebo plus statin	40 months	Global Cognition Screening [MMSE] Executive/attention/processing speed [modified Stroop Color-Word Test, Digit Symbol Test] Memory [Rey Auditory Verbal Learning]

		38.9% Female 73% White 13% <High school 25% High school graduate 33% Some college 28% college graduate or more Median MMSE (25 th and 75 th percentile): 28 (26-29)				
<i>Comparative Effectiveness</i>						
Muldoon 2004 ³ RCT United States Medium	189	Adults aged 35 to 70 years with low-density lipoprotein cholesterol level between 160 and 220 mg/dL and normal cognition. Mean age (SD): 53.7 (9.1) 52% Female 86% White Mean years education (SD): 14.8 (3.4) Mean Digit Vigilance (errors), and Recurring Words (errors): 6.6, 81.84.	Simvastatin 10 mg daily	Simvastatin 40 mg daily	6 months	Executive/attention/processing speed ^a [composite executive/attention/processing speed 1, composite executive/attention/processing speed 2] Memory [memory composite] Adverse Events
Carlsson 2002 ⁹ RCT- Crossover United States Medium	41	Adults ≥70 years with low-density lipoprotein-cholesterol ≥140 mg/dl and tri-glyceride levels ≤140 mg/dl and normal cognition. Mean age (SD): 76.3 (4.3) 68% Female Race: NR Education: NR Mean Digit Symbol Substitution (SD): 42.45 (9.69)	Pravastatin 20 mg daily	Tocopherol 440 IU daily	6 months	Executive/attention/processing speed [Digit Symbol Substitution Task] Adverse Events [physical adverse events and hospitalizations]

^aMuldoon 2004³ grouped tests into composite measures and if there was a significant difference in the composite measure individual items were evaluated. The composite measures were: 1) composite executive/attention/processing speed 1: Elithorn mazes, digit vigilance, recurring words, grooved pegboard; 2) memory composite 1: mirror tracing, 4-word short term memory, 3) memory composite 1: digit symbol, stroop interference, trail making B, digit span, complex figure, letter rotation;

^bMuldoon 2000⁵ grouped tests into composite measures and if there was a significant difference in the composite measure individual items were evaluated. The composite measures were: 1) composite measure of attention: digit vigilance, letter rotation, digit span, recurring words; 2) composite measure of psychomotor speed: grooved pegboard, Elithorn Maze, Digit Symbol; 3) composite of mental flexibility: Stroop Interference, Trail Making Digit Vigilance, Letter Rotation; 4) working memory composite: Associative Learning, Digit Span, 5) memory retrieval composite: Controlled Oral Word Association, Digit Symbol Recall, Verbal Recall, Complex Figure.

MMSE= Mini Mental Status Exam; NR=not reported; RCT=randomized controlled trial; SD=Standard Deviation; TICS=Telephone Interview Cognitive Status

Appendix Table N2. Summary risk of bias assessments: lipid lowering treatment in adults with normal cognition

Study	Overall Risk of Bias Assessment	Rationale
Williamson 2014 Williamson 2014 ⁸ (ACCORD Lipid trial)	Low (ACCORD Lipid-MIND trial) High (ACCORD Lipid-MIND MRI sub-trial)	Low (ACCORD Lipid-MIND trial) High (ACCORD Lipid MIND MRI sub-trial): Attrition 21%
Tendolkar 2012 ⁷	Low	
Trompet 2010 ¹	High	Attrition 25%

Appendix R. Other Interventions

Appendix Table R1. Characteristics of eligible studies: other interventions in adults with normal cognition

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex Race Education Baseline Cog	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
Other Medications						
Newhouse 2012 ¹ RCT US Medium	74	Non-smoking adults ≥55 with MCI (determined by subjective and objective impairments in cognitive function) Age, Mean (SD) 76 (7.6) 39% Female Race NR Years of Education, Mean (SD) 15.9 (2.7) MMSE, Mean (SD) 27.4 (2.0)	Transdermal nicotine patch 15 mg/day for 6 months	Placebo	6 months	Diagnosis: CDR Multidomain Neuropsychological Performance [Cognitive Drug Research Battery] Executive, Attention, Processing Speed [Connors Continuous Performance Test] Immediate and Delayed Paragraph Recall Test (NYU version) Digit Symbol Substitution Task
Forlenza 2011 ² RCT Brazil Medium	45	Community-dwelling adults ≥60 diagnosed with amnesic MCI per Mayo criteria. Age, Mean (SD) 72.5 (5.9) Sex NR Race NR Years of Education, Mean (SD) 10.5 (5.3) ADAS-Cog Score, Mean (SD)	Lithium titrated to serum levels 0.25-0.5 mmol/l (lower than dose for affective disorders); daily doses for 12 months	Placebo	12 months	Diagnosis [Clinical Dementia Rating Scale, Sum of Boxes] Multidomain Neuropsychological Performance [ADAS-Cog] Executive, Attention, Processing Speed [Trails A Time (seconds)] Executive, Attention, Processing Speed [Trails B Time (seconds)] Memory [CERAD Delayed recall] Memory [CERAD Figure recall] Memory [Sequence of Letters and Numbers score] (Cognitive Performance outcomes compared only baseline to endpoint within group, not

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex Race Education Baseline Cog	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
		10.9 (5.9)				between group) Biomarker [Amyloid-beta] Biomarker [Phosphorylated tau at threonine] Biomarker [Total tau]
Music Interventions						
Hars 2014 ³ Secondary analysis of RCT Switzerland Medium	134	Adults ≥65 at increased risk of falling Age, Mean (SD) 75 (7) 96.5% Female Race NR Education, 15% primary, 67% middle, 18% highschool MMSE, Mean (SD) 26.1 (2.9)	Weekly 1 hour supervised group class; multitask exercises to rhythm	Inactive control	6 months	Brief Cognitive Test Performance [MMSE] Visuospatial [Clock drawing test] Executive, Attention, Processing Speed [Trails A Time (seconds)]
Bugos 2007 ⁴ US RCT High	31	Musically naive older adults Age, Mean (SD) 70.5 (5.6) 81% Females Race NR Years of Education, Mean (SD) 16.4 (NR) No baseline cognitive screen	Individualized piano instruction ½ hour per week and independent practice 3 hours per week for 6 months. (Music theory instruction component)	Inactive control	9 months	Multidomain Neuropsychological Performance [Wechsler Adult Intelligence Scale (WAIS)] Executive, Attention, Processing Speed [Trails A Time (seconds)] Executive, Attention, Processing Speed [Trails B Time (seconds)]
Sleep interventions						
Lucassen 2014 ⁵ US RCT High	121	Short-sleeping (<6.5 hours/night), obese (BMI 30-55 kg/m2) adults Age, Mean (SD)	Sleep extension (up to 7.5 hours/night) with life-style modifications using personalized sleep plans	Continue current sleep habits; habits reviews every 2 months	Median 14 months	Wechsler Abbreviated Scale of Intelligence (WASI) Rey Complex Figure Test California Verbal Learning Test (CVLT-II) Grooved Peg Board Test (GPeg)

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex Race Education Baseline Cog	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
		41.1 (7) 76% Female 60% Black Years of Education NR No baseline cognitive screen				Wisconsin Card Sort Test (WCST) Trail Making Test A and B Verbal Fluency Test (FAS)
Sun 2013 ⁶ RCT China High	80	Adults ≥60 years with reduced sleep quality (Pittsburgh Sleep Quality Index >5) Age, Mean (SD) 69 (8) 74.7% Female Race NR 1.3% high school or above MMSE, Mean (SD) 24.2 (3.7)	Sleep hygiene educational pamphlet; guided progressive muscle relaxation tape (unclear frequency and duration; presumably daily for 12 months)	Sleep hygiene educational pamphlet	12 months	Brief Cognitive Test Performance [MMSE] Wechsler Memory Scale (Chinese revised)
Social Engagement						
Lam 2015 ⁷ RCT China High	276	Older adults with MCI (determined by subjective and objective impairments in cognitive function) and without dementia Age, Mean (SD) 75.4 (6.5) 78.2% Female Race NR Education Level (Years), Mean (SD)	Cognitive group (board games, reading/discussing newspapers) at least 3, 1-hr sessions/week	Social activities -At least 3, 1-hr sessions/week	12 months	Diagnosis [Clinical Dementia Rating Scale, Sum of Boxes] Multidomain Neuropsychological Performance [ADAS-Cog (Chinese version)] Brief Cognitive Test Performance [MMSE] Memory [Delayed recall] Language [CVFT]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex Race Education Baseline Cog	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
		3.9 (3.6) Catonese MMSE. Mean (SD) 25.6 (2.3)				
Mortimer 2012 ^b RCT China High	74	Adults age 60-79 with an education- adjusted Chinese MMSE score greater than 26 Age, Mean (SD) 67.8 (5.8) 67% Female Race NR Years of Education, Mean (SD) 11.7 (3.4) Mattis Dementia Scale Score, Mean (SD) 137.6 (7.6)	Group social interaction for 1 hour 3 times per week at a neighborhood community center	Inactive control with 4 check-in calls over 40 weeks	40 weeks	Executive, Attention, Processing Speed [WAIS digit span (forward)] Executive, Attention, Processing Speed [WAIS digit span (backward)] Visuospatial [Bell cancellation test] Visuospatial , Memory [Rey Figure (copying)] Visuospatial , Memory [Rey Figure (recall)] Executive, Attention, Processing Speed [Stroop Test (word)] Executive, Attention, Processing Speed [Stroop Test (color)] Executive, Attention, Processing Speed [Stroop Test (color-word)] Memory [Auditory Verbal Learning Test (immed. recall)] Memory [Auditory Verbal Learning Test (delayed recall)] Memory [Auditory Verbal Learning Test (delayed recognition)] Language [Category Verbal Fluency (animals)] Executive, Attention, Processing Speed [WAIS Similarities] Executive, Attention, Processing Speed [Trails A Time (seconds)] Executive, Attention, Processing Speed [Trails B Time (seconds)] Visuospatial [Clock drawing test] Language [Boston Naming Test (correct names)] Multidomain Neuropsychological Performance [Mattis Dementing Rating Scale (total score)] Executive, Attention, Processing Speed [Mattis Attention Score]

Study Design Country RoB	N=	Population Inclusion Age (mean) Sex Race Education Baseline Cog	Intervention Mode Components Frequency Duration	Comparison Mode Components Frequency Duration	Outcome timing	Outcome Domain [Instrument]
						Executive, Attention, Processing Speed [Mattis Initiation Score] Visuospatial Mattis Construction Score] Executive, Attention, Processing Speed Mattis Conceptualization Score] Memory [Mattis Memory Score] Biomarker [Whole brain volume (% of total intracranial volume)]
