

Evidence-based Practice Center Systematic Review Protocol

Project Title: *Pharmacologic and Nonpharmacologic Treatments for Posttraumatic Stress Disorder: An Update of the PTSD Repository Evidence Base*

I. Background and Objectives for the Systematic Review

Posttraumatic stress disorder (PTSD) is a prevalent disorder with significant negative impacts on health, quality of life, and healthcare utilization.¹ Lifetime prevalence of PTSD is estimated to be six percent in American civilians^{2,3} and seven to nine percent in Veterans.^{4,5} Since PTSD was first included by the Diagnostic and Statistical Manual of Mental Disorders, third edition (DSM-III) in 1980, there have been over 500 published randomized controlled trials (RCTs) evaluating a vast number of treatments and treatment modalities (e.g., psychotherapy, psychopharmacotherapy, complementary approaches, etc.). Given the large and varied body of evidence, even some of the most comprehensive systematic reviews on PTSD have excluded some intervention types (e.g., complementary and integrative approaches) due to the prohibitively large number of studies that would have to be reviewed.⁶ Without a comprehensive database containing all published RCTs on PTSD, clinicians and researchers may need to consult multiple reviews in order to synthesize evidence across studies and evaluate the effectiveness and comparative effectiveness of treatments. However, heterogeneity of review methods, scope, and data presentation make it difficult to synthesize across reviews and have led to variation in conclusions.^{7,8} Methodological differences, such as data coding approaches and combining treatment categories for analysis, further limit the generalizability of findings.

Systematic reviews typically abstract a small number of data elements pertinent to the scope of the review due to resource constraints. Furthermore, even when abstracted data are made publicly available, they may be presented in a format that does not readily lend itself to re-analyses without reformatting or re-entry. Hence, there is a need for a single source that provides up-to-date, detailed, comprehensive data on existing PTSD trials to better address current clinical, research, and policy stakeholders' needs.

To meet this need, databases were initially developed in two previous AHRQ reports, a 2019 report (Pharmacologic and Nonpharmacologic Treatments for Posttraumatic Stress Disorder: Groundwork for a Publicly Available Repository of Randomized Controlled Trial Data) and subsequent 2020 report (Pharmacologic and Nonpharmacologic Treatments for Posttraumatic Stress Disorder: An Update of the PTSD-Repository Evidence Base).^{9,10} These databases were then converted into an online, accessible, interactive data repository disseminated by the National Center for PTSD (NCPTSD), called the PTSD Trials Standardized Data Repository, or "PTSD-Repository."¹¹ Since then, the database was updated in reports released in 2022¹² and 2023,¹³ and will be updated again through this evidence review. The PTSD-Repository could (1) serve as a data source for future systematic reviews, meta-analyses, or other cross-study comparisons; (2) help identify research gaps to determine future research priorities; (3) encourage researchers to adopt standard data elements in research and reporting; (4) serve as a source for clinicians seeking information on effectiveness of interventions for patients with particular demographics or exposures; (5) provide the public a source to search for evidence on interventions they or their loved ones are considering; (6) provide policymakers with an up-to-date accounting of evidence to respond to inquiries; and (7) augment and inform the use of existing patient education tools such as PTSD mobile applications¹⁴

or the online PTSD Treatment Decision Aid.¹⁵

This review will update the literature base and build on the PTSD-Repository by adding newly-published studies, assessing risk of bias using the Cochrane risk-of-bias tool for randomized trials (RoB 2),¹⁶ and calculating standardized effect sizes. As part of the update process, corresponding authors of publications added in the 2022 update¹² will be notified of their study's inclusion and invited to submit any corrections to the study team. These data will be available through the resulting report and excel files, as well as the PTSD-Repository.

II. Key Questions

Key Question. What interventions have been studied for the treatment of PTSD alone or with comorbid substance use disorder (SUD)?

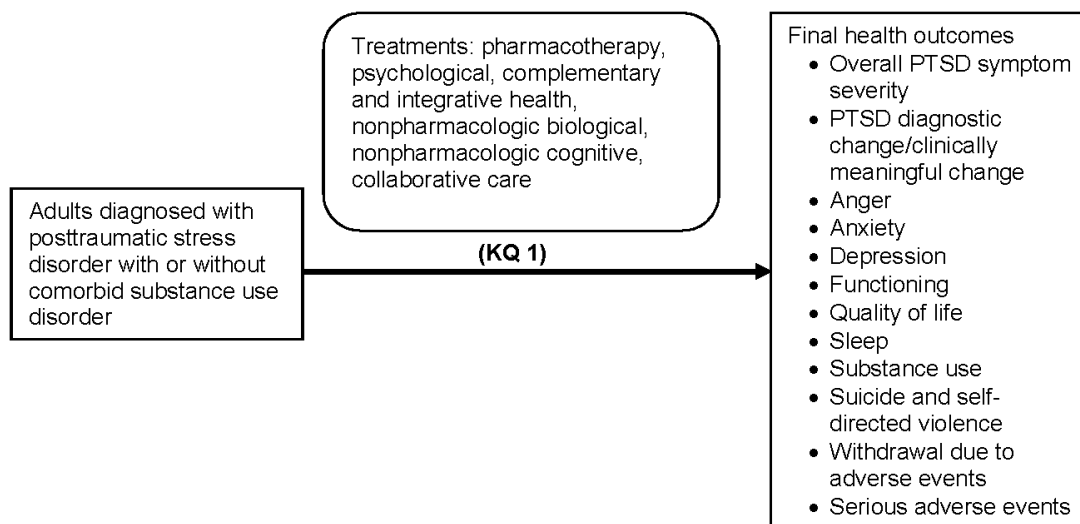

This review will update the literature for this Key Question from previous reviews.^{9,10,12,13} The PICOTS (Populations, Interventions, Comparators, Outcomes, Timing, Settings, Study Design) criteria are:

- **Population(s):**
 - Adults (≥ 18 years old) diagnosed with PTSD by a clinician or through patient-reported assessment tool
- **Interventions:**
 - Pharmacologic and nonpharmacologic interventions, including complementary and integrative approaches, for PTSD or comorbid PTSD/SUD
- **Comparators:**
 - Any comparator, including another intervention, waitlist/minimal attention, usual care, or placebo
- **Outcomes:**
 - Overall PTSD outcome, PTSD diagnostic change, PTSD clinically meaningful change
 - Other outcomes - anxiety, anger, depression, functioning, quality of life, sleep, substance use, suicide and self-directed violence, withdrawal due to adverse events, serious adverse events
- **Timing:**
 - No limitation on study duration or length of follow up
- **Settings:**
 - No limitation on study setting
- **Study Design:**
 - Randomized controlled trials

III. Analytic Framework

The analytic framework (Figure 1) illustrates how PTSD treatments may be associated with health and functional outcomes including PTSD symptoms and diagnosis, substance use, anxiety, depression, and quality of life; as well as how these interventions may be associated with harms.

Figure 1. Analytic Framework for Pharmacologic and Nonpharmacologic Treatments for Posttraumatic Stress Disorder

IV. Methods

Criteria for Inclusion/Exclusion of Studies in the Review

Detailed inclusion and exclusion criteria for the Key Question are listed in Table 1 and are consistent with the PICOTS described above in Section II.

Table 1. PICOTS: Inclusion and exclusion criteria

PICOTS	Include	Exclude
Populations	<ul style="list-style-type: none"> Adults (mean age ≥ 18 years old) with PTSD diagnosed by a clinician or through the administration of a validated clinician-administered or patient-reported assessment tool 	<ul style="list-style-type: none"> Children (mean age < 18 years old) Diagnosis of acute stress disorder Studies that do not specify criteria used to diagnose PTSD Sample population with $< 80\%$ of participants diagnosed with PTSD (i.e., $> 20\%$ with study-defined subthreshold PTSD), or if include comorbid SUD, $< 80\%$ of participants diagnosed with comorbid PTSD/SUD
Interventions	<ul style="list-style-type: none"> Pharmacologic and/or nonpharmacologic interventions for PTSD or comorbid PTSD/SUD in adults. Interventions can include any pharmacologic component, whether singly, in combination with other treatment categories, or compared with another intervention category, or complementary and integrative approaches, nonpharmacologic biologic treatments, and psychotherapeutic treatments. Interventions designed to treat insomnia and nightmares related to PTSD No limitation on delivery format or provider type; provider involvement not required. 	<ul style="list-style-type: none"> Interventions designed to simultaneously target PTSD and comorbid conditions other than SUD if they cannot be standalone PTSD interventions (i.e., interventions targeting PTSD and a comorbidity such as depression are included if the intervention can be a treatment for PTSD alone). Interventions designed to prevent PTSD, treat self-stigma, or facilitate posttraumatic growth are excluded unless they are designed to treat PTSD directly as well.
Comparators	<ul style="list-style-type: none"> No limitations applied. Direct head-to-head comparisons of PTSD interventions will be included. Interventions such as waitlist/minimal attention, usual care, placebo, or other minimally-active treatment (e.g., education or attention control) are categorized as "Controls" 	None
Outcomes	<ul style="list-style-type: none"> Any overall PTSD outcome 	<ul style="list-style-type: none"> Studies reporting only individual symptoms or symptom clusters without overall PTSD outcome Studies that did not perform formal statistical test for between-group comparison of a PTSD outcome
Timing	<ul style="list-style-type: none"> Any study duration and length of follow up 	None
Setting	<ul style="list-style-type: none"> All study settings 	None
Study Design	<ul style="list-style-type: none"> RCTs 	<ul style="list-style-type: none"> Non-RCTs Selected systematic reviews will be considered as reference check sources of studies to be reviewed for possible inclusion (data will be abstracted from individual studies rather than from systematic reviews)

PTSD = posttraumatic stress disorder; RCTs = randomized controlled trials; SUD = substance use disorder

Literature Search Strategies to Identify Relevant Studies to Answer the Key Questions:

Publication Date Range: Electronic databases will be searched for evidence from March 1, 2023 to present, subsequent to the last database search for the prior update report.¹³ An updated literature search will be conducted concurrently with the peer review and public comment process and any new literature identified that meets inclusion criteria will be incorporated into the report.

Literature Databases: PTSDpubs (formerly PILOTS), Ovid® MEDLINE®, Cochrane CENTRAL,

Embase[®], the Cumulative Index to Nursing and Allied Health Literature (CINAHL[®]), SCOPUS, and PsycINFO[®]. Search strategies are in Appendix A.

Gray Literature: A gray literature search will not be conducted. Due to the nature of the project, a portal for submission of Supplemental Evidence And Data for Systematic review (SEADS) will not be opened for this project.

Hand Searching: Reference lists of relevant, recent, high-quality systematic reviews or meta-analyses identified in the search will be reviewed to identify RCTs eligible for inclusion.

Process for Selecting Studies: PICOTS described in Section II and criteria in Table 1 will be used to determine eligibility for inclusion and exclusion of abstracts. One investigator will determine eligibility at the title/abstract review stage and a second investigator will review excluded studies. For studies included at the title/abstract review stage, the full-text will be retrieved and reviewed independently for eligibility by two investigators. Any disagreements will be resolved by consensus of the team of investigators.

Contacting Study Authors: The EPC will send an email to the list of corresponding authors for all new studies included in the prior update report,¹³ notifying them of the inclusion of their study and providing the report public link on the AHRQ website. If study authors respond and report missing study data, corrections, or other study information relevant to evidence table variables, the EPC will document this information in the updated evidence tables, including information obtained from published materials in the evidence table, and reporting unpublished information provided by study authors in evidence table notes or other sections of the final report indicating the unpublished source(s).

Data Abstraction and Data Management:

After studies are screened and determined to meet inclusion criteria, we will abstract study design, year, setting, country, sample size, eligibility criteria, source(s) of funding, study characteristics, population characteristics, intervention characteristics, and results using the Microsoft[®] Excel evidence table template used in the previous two updates^{12,13} (see Appendix B for detailed list of data elements). All study data will be verified for accuracy and completeness by a senior investigator. A record of studies excluded at the full-text level with reasons for exclusion will be maintained.

Assessment of Methodological Risk of Bias of Individual Studies:

The EPC will conduct a risk of bias (RoB) assessment for each of the new studies identified in this update using RoB 2.¹⁶ RoB will be assessed by one person on the research team and checked for accuracy by a second, with any disagreements resolved through consensus. To ensure transparency and ease of future updating, the EPC will include detailed definitions related to how RoB was assessed, and abstract RoB-related data into additional columns focused on documenting the analysis type (e.g., intent to treat, per protocol), the overall percent of missing primary PTSD outcome assessment data (i.e., overall attrition from measurement), and the percent of missing primary PTSD outcome data in each of the arms of the study (i.e., differential attrition from measurement).

Data Synthesis:

Characteristics of included studies, such as number of publications by year, study sample size, proportion of studies enrolling community versus military population, and distribution of studies by PTSD assessment method, will be summarized in descriptive tables and text, though no formal data synthesis will be completed as part of this project. All studies, regardless of overall RoB rating, will be incorporated in the descriptive summaries. Results from studies will not be

synthesized quantitatively.

Grading the Strength of Evidence (SOE) for Major Comparisons and Outcomes:

Strength of evidence will not be assessed as a part of this project, nor will we assess applicability.

VI. Definition of Terms

Not applicable.

VII. Summary of Protocol Amendments

If the EPC needs to amend the protocol, we will give the date of each amendment, describe the change, and provide rationale in this section. Changes will not be incorporated into the protocol.

VIII. Technical Experts

Technical Experts constitute a multi-disciplinary group of clinical, content, and methodological experts who provide input in defining populations, interventions, comparisons, or outcomes and identify particular studies or databases to search. The Technical Expert Panel is selected to provide broad expertise and perspectives specific to the topic under development. Divergent and conflicting opinions are common and perceived as healthy scientific discourse that fosters a thoughtful, relevant systematic review. Therefore, study questions, design, and methodological approaches do not necessarily represent the views of individual technical and content experts.

Technical Experts provide information to the EPC to identify literature search strategies and suggest approaches to specific issues as requested by the EPC. Technical Experts do not do analysis of any kind; neither do they contribute to the writing of the report. They do not review the report, except as given the opportunity to do so through the peer or public review mechanism.

Members of the TEP must disclose any financial conflicts of interest greater than \$5,000 and any other relevant business or professional conflicts of interest. Because of their unique clinical or content expertise, individuals are invited to serve as Technical Experts and those who present with potential conflicts may be retained. The AHRQ TOO and the EPC work to balance, manage, or mitigate any potential conflicts of interest identified.

IX. Peer Reviewers

Peer reviewers are invited to provide written comments on the draft report based on their clinical, content, or methodological expertise. The EPC considers all peer review comments on the draft report in preparing the final report. Peer reviewers do not participate in writing or editing of the final report or other products. The final report does not necessarily represent the views of individual reviewers.

The EPC will complete a disposition of all peer review comments. The disposition of comments for systematic reviews and technical briefs will be published 3 months after publication of the evidence report.

Potential peer reviewers must disclose any financial conflicts of interest greater than \$5,000 and any other relevant business or professional conflicts of interest. Invited peer reviewers with any financial conflict of interest greater than \$5,000 will be disqualified from peer review. Peer reviewers who disclose potential business or professional conflicts of interest can submit comments on draft reports through the public comment mechanism.

X. EPC Team Disclosures

EPC core team members must disclose any financial conflicts of interest greater than \$1,000 and any other relevant business or professional conflicts of interest. Direct financial conflicts of interest that cumulatively total more than \$1,000 will usually disqualify an EPC core team investigator.

XI. Role of the Funder

This project was funded under Contract No. 75Q80120D00006 from the Agency for Healthcare Research and Quality, U.S. Department of Health and Human Services. The AHRQ Task Order Officer reviewed the EPC response to contract deliverables for adherence to contract requirements and quality. The authors of this report are responsible for its content. Statements in the report should not be construed as endorsement by either the Agency for Healthcare Research and Quality or the U.S. Department of Health and Human Services.

XII. Registration

Because this is a data abstraction and evidence base expansion project and not a systematic review, this protocol will not be registered in the international prospective register of systematic reviews (PROSPERO).

APPENDIX B. DATA ABSTRACTION ELEMENTS

Study Identifiers

1. Author
2. Year of publication
3. Bibliographic citation
4. PubMed ID
5. PTSDpubs (formerly PILOTS) ID number, if available
6. ClinicalTrials.gov identifier
7. Funding source

Inclusion-Exclusion Criteria

1. Study-reported inclusion and exclusion criteria

Study Characteristics

1. Year of publication
2. Study class
3. Country/Countries of study sites
4. Site type
5. Clinical setting
6. Study design
7. Subscale/symptom cluster data reported indicator
8. Subgroup analysis reported indicator
9. Psychotherapy providers have graduate degree indicator
10. Intervention includes group therapy indicator
11. Allowed PTSD psychotherapy, other psychotherapy, and psychotropic medication indicators
12. Patients with suicidality excluded indicator
13. Suicide- and self-directed violence-related inclusion and exclusion criteria
14. Psychotic disorder- and symptom-related inclusion and exclusion criteria
15. Suicide or self-harm related outcomes reported indicator
16. Diagnostic measure(s) and assessment type
17. Operational definition of PTSD (i.e., score or cutoff required for inclusion)
18. Study comments

Sample Characteristics

1. Number of randomized participants
2. Proportion of participants meeting study-defined criteria for PTSD at baseline
3. Mean PTSD severity at baseline
4. Duration of PTSD symptoms/diagnosis
5. % Active Duty Military
6. % Veteran Percent
7. % Service-Connected Veteran
8. % Community
9. Military Status
10. Mean age
11. % Female/Male sex
12. Gender and sexual orientation, if reported
13. Race % (by U.S. Census categories)
14. Ethnicity % (by U.S. Census categories)
15. % Treatment-naïve
16. % with comorbidities: depression, substance use disorder (SUD), traumatic brain injury, suicide or self-directed violence, psychotic disorder or related symptoms, personality disorder, anxiety disorder
17. SUD substance class and specific substance target
18. Current SUD inclusion/exclusion criteria

19. Prior inpatient hospitalization %
20. Participants' trauma type(s)
21. Mean number of trauma types and traumatic events experienced per participant

Study Interventions

1. Number of participants randomized to each study arm
2. Treatment Name and Standardized treatment name
3. Treatment Description
4. Treatment Focus (PTSD, PTSD+SUD, SUD, Active Control, Inactive Control)
5. Intervention Categorization (Psychotherapy, Pharmacotherapy, CIH, Nonpharmacologic Biologic, Nonpharmacologic Cognitive Therapy, Collaborative Care, Other)
6. Intervention format and delivery method
7. Treatment dose and/or session length
8. Frequency of treatment
9. Duration of treatment
10. Definition of treatment completion and/or adherence
11. Proportion of participants who completed and/or adhered to treatment
12. Mean number of psychotherapy sessions completed or dose of pharmacotherapy

PTSD Continuous Outcomes

1. PTSD outcome measure and assessment type
2. Analysis Type
3. Method for Handling Missing Data
4. Statistical Analysis Method
5. Adjusted Variables in Statistical Analysis
6. Assessment timepoint(s)
7. Number of participants who completed the outcome assessment
8. Within-group results: mean scores, score difference, within-group effect size(s), calculated within-group standardized effect size (Cohen's d analog)
9. Between-group results: score difference, between-group effect size(s), calculated between-group standardized effect size (Hedges' g)

PTSD Dichotomous Outcomes

1. Outcome type (PTSD diagnostic change, clinically meaningful response)
2. Outcome definition
3. Method for Handling Missing Data
4. Analysis Type
5. Statistical Analysis Method
6. Adjusted Variables in Statistical Analysis
7. Assessment timepoint(s)
8. Within-group results: proportion of participants achieved diagnostic change and/or clinically meaningful response
9. Between-group results: between-group effect size for diagnostic change and/or clinically meaningful response

Additional Outcomes

1. Results for suicide- or self-directed violence-related outcomes
2. Between-group effect sizes for depression, anxiety, sleep, anger, quality of life, function, and substance use outcomes
3. Harms outcomes (withdrawals due to adverse events, serious adverse events, attempted suicide, completed suicide)

APPENDIX C. RoB 2, A REVISED TOOL FOR ASSESSING RISK OF BIAS IN RANDOMISED TRIALS: ASSESSMENT ELEMENTS

- 1.1) Was the allocation sequence random?
- 1.2) Was the allocation sequence concealed until participants were enrolled and assigned to interventions?
- 1.3) Did baseline differences between intervention groups suggest a problem with the randomization process?
- 2.1) Were participants aware of their assigned intervention during the trial?
- 2.2) Were carers and people delivering the interventions aware of participants' assigned intervention during the trial?
- 2.3) (If Yes, Probably Yes, or No Information to masking carers or participants) Were there deviations from the intended intervention that arose because of the trial context?
- 2.4) (If Yes, Probably Yes to previous question) Were these deviations likely to have affected the outcome?
- 2.5) (If Yes, Probably Yes, No Information to previous question) Were these deviations from intended intervention balanced between groups?
- 2.6) Was an appropriate analysis used to estimate the effect of assignment to intervention?
- 2.6 Detail) List type of analysis
- 2.7) (If No, Probably No, No Information to previous question) Was there potential for a substantial impact (on the result) of the failure to analyse participants in the group to which they were randomized
- 3.1) Were data for this outcome available for all, or nearly all, participants randomized?
- 3.1 Detail) List overall % of missing outcome (i.e., overall attrition) data
- 3.2) (If No/Probably No/No Information to previous question) Is there evidence that the result was not biased by missing outcome data?
- 3.3) (If No/Probably No to previous question) Could missingness in the outcome depend on its true value?
- 3.4) (If Yes, Probably Yes, No Information to previous question) Is it likely that missingness in the outcome depended on its true value?
- 3.4 Detail) List % of missing outcome data (i.e., differential attrition) in each group
- 4.1) Was the method of measuring the outcome inappropriate?
- 4.2) Could measurement or ascertainment of the outcome have differed between intervention groups?
- 4.3) (If No/Probably No/No Information to both previous questions) Were outcome assessors aware of the intervention received by study participants?
- 4.4) (If Yes/Probably Yes/No Information to previous question) Could assessment of the outcome have been influenced by knowledge of intervention received?
- 4.5) (If Yes/Probably Yes/No Information to previous question) Is it likely that assessment of the outcome was influenced by knowledge of intervention received?
- 5.1) Were the data that produced this result analysed in accordance with a pre-specified analysis plan that was finalized before unblinded outcome data were available for analysis?
- 5.2) Is the numerical result being assessed likely to have been selected, on the basis of the results, from multiple eligible outcome measurements (e.g. scales, definitions, time points) within the outcome domain?
- 5.3) Is the numerical result being assessed likely to have been selected, on the basis of the results, from multiple eligible analyses of the data?
